ALLIGARE TEBUTHIURON 80 WG

A Herbicide for preemergence and postemergence use. Controls woody plant species, brush and weeds on noncrop areas, including rangeland, permanent grass pastures, fencerow, and clearings for wildlife habitat.

Not for sale, distribution, or use in Nassau or Suffolk counties in New York State.
Alligare Tebuthiuron 80 WG will kill trees and shrubs. Carefully read the precautions before using.

**ACTIVE INGREDIENT:**
Tebuthiuron: N-(5-(1,1-dimethyllethyl)-1,3,4-thiadiazol-2-yl)-N'-dimethylurea .................................................................................................................. 80.0%

**OTHER INGREDIENTS:** .................................................................................................................. 20.0%

**TOTAL:** ................................................................................................................................. 100.0%

Contains 20 pounds active ingredient per 25 pound bag

EPA Reg. No. 81927-37

EPA Est. No. 11602-ISR-001™; 81927-AL-001™
39579-TX-001™; 5905-IA-001™

Letter(s) in lot number correspond(s) to superscript in EPA Est. No.

**KEEP OUT OF REACH OF CHILDREN**

**CAUTION / PRECAUCIÓN**

usted no entiende la etiqueta, busque a alguien para que se la explique a usted en detalle. (If you do not understand the label, find someone to explain it to you in detail.)

---

**FIRST AID**

| swallowed: | • Call a poison control center or doctor immediately for treatment advice. |
| — | • Have person sip a glass of water if able to swallow. |
| — | • Do not induce vomiting unless told to do so by the poison control center or doctor. |
| — | • Do not give anything by mouth to an unconscious person. |

| on skin or clothing: | • Take off contaminated clothing. |
| — | • Rinse skin immediately with plenty of water for 15-20 minutes. |
| — | • Call a poison control center or doctor for treatment advice. |

| in eyes: | • Hold eye open and rinse slowly and gently with water for 15-20 minutes. |
| — | • Remove contact lenses, if present, after the first 5 minutes, then continue rinsing eye. |
| — | • Call a poison control center or doctor for treatment advice. |

| inhaled: | • Move person to fresh air. |
| — | • If person is not breathing, call 911 or an ambulance, then give artificial respiration, preferably mouth-to-mouth, if possible. |
| — | • Call a poison control center or doctor for further treatment advice. |

---

**HOT LINE NUMBER**

Leave the product container or label with you when calling a poison control center or doctor, or going for treatment. You may also contact 1-800-424-9300 for emergency medical treatment information.

See inside label booklet for additional PRECAUTIONARY STATEMENTS.

Manufactured for: Alligare, LLC
13 N. 8th Street • Opelika, AL 36801

Net Weight: 25 lbs.
HAZARDS TO HUMANS AND DOMESTIC ANIMALS

CAUTION: Harmful if swallowed or absorbed through the skin. Causes eye irritation. Avoid contact with eyes, skin or clothing. Wash thoroughly with soap and water after handling and before eating, drinking, chewing gum, using tobacco, or using the toilet. Remove and wash contaminated clothing before reuse. Wear long-sleeved shirt, long pants, shoes, socks, and chemical-resistant gloves made of any waterproof material when handling or applying this product.

Environmental Hazards

Precaution: Do not use Alligare Tebuthiuron 80 WG herbicide in any area where desirable species are in the vicinity of the plants to be controlled. A small amount of Alligare Tebuthiuron 80 WG in contact with the roots of desirable trees or other woody species may cause severe injury or death. The roots of such plants may extend far beyond their drip lines.

Do not apply directly to water, to areas where surface water is present or to intertidal areas below the mean high water mark. Do not contaminate water when disposing of equipment washer or rinseate.

Ground Water Advisory: This product is known to leach through soil into ground water under certain conditions as a result of registered (rangeland and non-crop) uses. Use of this product in areas where soils have rapid to very rapid permeability, particularly where the water table is shallow, may result in ground water contamination.

Use Restrictions for Groundwater Protection

Vulnerable Sites: To minimize any movement of tebuthiuron to subsurface water, do not exceed the application rates specified below on treatment sites where soils have a sand or loamy sand texture throughout the soil profile and all of the following characteristics:

1. Rapid to very rapid permeability,
2. Absence of well-defined organic layers or a textural B-horizon (restricting layer of fine-textured soil),
3. The water table of an underlying aquifer is shallow.

The maximum use rates for Alligare Tebuthiuron 80 WG in areas described above are:

- Less than 20 inches annual precipitation: Do not apply more than 1.25 lb/acre Alligare Tebuthiuron 80 WG.
- Greater than 20 inches annual precipitation: Do not apply more than 2.5 lb/acre Alligare Tebuthiuron 80 WG.

Refer to the Woody Plants Controlled section of this label for plant species controlled at these application rates.

"An aquifer is defined as "an underground saturated, permeable, geologic formation capable of producing significant quantities of water to a well or spring." It is the ability of the saturated zone, or portion of that zone, to yield water which makes it an aquifer" (American Chemical Society, 1983). Local agricultural agencies can provide further information on the type of soil in your area and the location of shallow ground water aquifers.

Do not apply Alligare Tebuthiuron 80 WG in areas where the water table is predominantly shallow (5 feet or less), such as marshy or sub-irrigated areas, or areas immediately adjacent to streams or lakes which are periodically flooded, unless such use is allowed under a state-approved pesticide management program. Note: Also on such areas, woody plants rooted directly in a shallow water table are minimally affected by applications of tebuthiuron and poor woody plant control will result.

Do not apply Alligare Tebuthiuron 80 WG where bedrock is continuously exposed or in areas of bedrock overlain by soils that are shallow or discontinuous.

Do not apply Alligare Tebuthiuron 80 WG in areas adjacent to sinks or sinks or depressions lacking external drainage, which occur within areas of karst topography.

Do not apply Alligare Tebuthiuron 80 WG to high shrink/swell soils (vertisols) which develop deep cracks upon drying.

Do not apply Alligare Tebuthiuron 80 WG within areas identified by state or local authorities as protected ground water recharge zones.

DIRECTIONS FOR USE

It is a violation of Federal law to use this product in a manner inconsistent with its labeling. Read all Directions for Use carefully before applying.

Do not apply this product through any type of irrigation system.

General Information

Alligare Tebuthiuron 80 WG is a surface applied, soil-active product intended for total vegetation control in non-cropland and for woody plant control in non-cropland, rangeland and permanent pastures. Applied as a broadcast treatment, Alligare Tebuthiuron 80 WG is generally non-selective to (will control) annual grasses, annual and perennial broadleaf and broadleaf woody plants. Perennial warm-season grasses are generally tolerant to Alligare Tebuthiuron 80 WG, but may exhibit injury during the season following application. Cool season perennial grasses are not tolerant to broadcast applications of this product except at rates less than 0.5 lb active ingredient.

Applied as a banded treatment, Alligare Tebuthiuron 80 WG may be used to control woody plants in non-cropland, rangeland and pasture sites. With banded treatments, effects of herbaceous vegetation are confined mainly to the treated band, but may last more than one growing season. Dormant season application and keeping the treated band as narrow as possible is recommended to minimize herbicidal effects on perennial grasses and to lessen effects on other herbaceous plants.

Treatments become effective after sufficient rainfall has occurred to move the active ingredient in Alligare Tebuthiuron 80 WG into the root zone. Herbicidal symptoms appear more rapidly when applied just before seasonal rainfall. Susceptible herbaceous plants exhibit leaf chlorosis followed by browning before the plant dies. Woody plants exhibit leaf chlorosis and browning followed by defoliation. Woody plants may undergo several defoliation cycles, usually following significant rainfall before death occurs. Time required to achieve control of woody vegetation depends on susceptibility of target species, rainfall and soil conditions and may vary from a single growing season to several years. Lack of rainfall will delay herbicidal activity and lengthen the time required for control.

For best woody plant control results with Alligare Tebuthiuron 80 WG, do not disturb intact plants by practices such as wood cutting, chaining, or burning for two years after application. Resprouting or survival of woody plants is more likely to occur if plants are disturbed before complete control occurs.

Use Precautions and Restrictions

Read the entire label before using Alligare Tebuthiuron 80 WG to determine if this product is suitable for the desired purpose.

Not for sale, distribution, or use in Nassau and Suffolk Counties in New York State

This product is not registered in the state of Florida.
Not for Residential Use.

Alligare Tebufuron 80 WG is an extremely active herbicide which will kill trees, shrubs, and other forms of desirable vegetation having roots extending into the treated area. Feeder roots of many species of desirable vegetation extend many feet beyond the drip line of the branches, and a very small amount of Alligare Tebufuron 80 WG In contact with one feeder root of a tree, shrub, or other desirable vegetation may cause serious injury or death to the entire plant.

Recommended Treatment Setback: Do not apply Alligare Tebufuron 80 WG in the vicinity of desirable plants. Exposure of even a small part of a plant root system to Alligare Tebufuron 80 WG may cause severe plant injury or death. Plant roots usually occupy an area much larger than the aerial portion of the plant. Treatment setback distance should be 2 times the height or width of adjacent non-target vegetation, whichever is greater. For example, if adjacent non-target vegetation is 25 feet tall, the treatment setback should be 50 feet.

An Arboriculturist (tree expert) should be consulted to help you to determine if the area of proposed application is free of all roots of desirable vegetation. The effect of Alligare Tebufuron 80 WG on desirable vegetation may be irreversible and its presence in the soil may prevent growth of other desirable vegetation for some years after application.

Do not use Alligare Tebufuron 80 WG on areas such as walks, driveways, streets, lawns, patios, tennis courts, swimming pools, cemeteries, or other landscaped areas, or under asphalt or concrete pavement where future landscaping is planned. Do not apply on field crops. Do not apply on any area into which the roots of field crops or other desirable vegetation may extend. Roots of trees, shrubs, and other desirable vegetation may extend far beyond the drip line of the plant's branches.

Avoid non-target drift or product movement. Do not apply when winds are gusty or under any other condition which will allow drift or product movement. Do not apply to areas where soil movement by water erosion and/or natural or mechanical means is likely. Avoid treatment or areas susceptible to wind erosion such as single grain stands or disturbed soils that are loose and powdery dry. Under these conditions, treatment should be delayed until the soil surface has been stabilized by rainfall or irrigation. Before treatment of sandy soils in areas subject to wind erosion, the soil surface should first be stabilized with gravel mulch or other means of preventing physical movement of surface soil. Drift or any form of product movement from treated areas may cause damage to any vegetation to which treatment is not intended.

Do not apply Alligare Tebufuron 80 WG to interior ditchbanks (areas which slope toward the drainage). Do not apply to ditches used to transport irrigation to potable water.

Thoroughly clean all traces of Alligare Tebufuron 80 WG from application equipment after use. Do not empty residues cleaned from application equipment on areas where they may come in contact with the roots of desirable vegetation or the water source for such vegetation.

Alligare Tebufuron 80 WG may injure or suppress certain herbaceous vegetation in the treated area. Therefore, do not apply where such injury cannot be tolerated. Do not apply broadcast applications of Alligare Tebufuron 80 WG where forage or maintenance of grass cover is desired. Injury to most herbaceous perennials is reduced if Alligare Tebufuron 80 WG is applied when this vegetation is dormant.

Grazing and Haying Restrictions
If the treated area is to be used for haying or grazing, do not apply more than 5 pounds per acre of Alligare Tebufuron 80 WG, and do not apply the product more than once a year. There are no grazing restrictions following band or individual plant treatment application of Alligare Tebufuron 80 WG at 5 pounds per acre or less.

Haying Restriction: In areas receiving band or individual plant treatments of 5 pounds per acre or less of Alligare Tebufuron 80 WG, grass may be cut for hay one year after application.

Frequency of Application and Maximum Use Rates
Vegetation Control by Ground Broadcast or Banded Application:
• The maximum use rate and frequency of application is 1.25 to 2.5 lb of Alligare Tebufuron 80 WG (1 to 2 lb a.i.) per acre once every three years for vulnerable sites where soils are sandy and depth to water table is shallow. (Refer to Environmental Hazards section under Use Restrictions for Ground Water Protection.)
• For all other areas, the maximum use rate and frequency of application is up to 5 lb of Alligare Tebufuron 80 WG (4 lb a.i.) per acre once every three years; and no more than two treatments totaling 7.5 lb of Alligare Tebufuron 80 WG (6 lb a.i.) per acre in any 6 year period.

Total Vegetation Control and Maintenance of Bare Ground by Ground Broadcast Only: The maximum use rate and frequency of application is up to 5 lb of Alligare Tebufuron 80 WG (4 lb a.i.) per acre applied only once per year; however, no more than 7.5 lb of Alligare Tebufuron 80 WG (6 lb a.i.) per acre may be applied in any 3 year period.

Spot treatments (Hand-held Equipment): May be applied at rates up to 7.5 lb of Alligare Tebufuron 80 WG (5 lb a.i.) per acre when needed.

Rotation of Treated Areas to Plants other than Forage Grasses
It is intended that Alligare Tebufuron 80 WG be applied to rangeland, permanent pastures and non-crop land areas that will not be rotated to crop production, or other use involving planting or transplanting of herbaceous or woody plants susceptible to tebufuron. Do not rotate areas treated with this product to any seeded crop, planted or transplanted plant species other than forage grasses until an adequately sensitive field bioassay demonstrates that the level of tebufuron present in the soil will not adversely affect such plantings.

Field Bioassay Instructions: In areas where tebufuron was previously applied, plant test rows of the intended rotational crop or plant species across the original direction of application in a manner to sample variability in field conditions such as soil texture, soil organic matter, soil pH, or drainage. The field bioassay can be initiated one or more years following application of this product to rangeland, permanent pastures or non-crop areas. Observe the test planting for symptoms of herbicidal activity, such as poor stand (failure to establish), chlorosis (yellowing), and necrosis (dead leaves or shoots), or stunting (reduced growth). Observation of the test planting for an entire use season is recommended to evaluate the full range of conditions that may give rise to herbicidal symptoms. If herbicidal symptoms do not occur, the test crop or plant species can be grown. Practices that may hasten the degradation of tebufuron are establishment of perennial warm season grasses which are effective in the removal and metabolism of soil residues and supplemental irrigation.

Mixing Directions
Thorough mixing and continuous agitation are important to ensure uniform application. Fill the spray tank half-full of water. Start agitation and continue agitation during entire mixing and spraying operation. Add the required amount of Alligare Tebufuron 80 WG and allow it to mix thoroughly while completing the spray tank filling. If additional product is a liquid, add slowly while filling remainder of tank with water.
Material must be kept in suspension at all times by continuous agitation. If bypass (hydraulic) agitation is used, the return flow should terminate at the bottom of the mixing tank to minimize foaming. Check the sprayer frequently before and during use to insure proper calibration and uniform application.

A master shut-off switch for the entire spraying system and nozzle check valves are recommended on commercial spray equipment.

If hand held or backpack type sprayers are used, determine the amount of water and chemical necessary to cover uniformly the area to be treated. Shake vigorously after filling and periodically during application to maintain product in suspension.

**Application Methods**

**Broadcast Application**

Apply Alligare Tebutiuron 80 WG in a spray volume of 5 or more gallons of water per acre by ground. Apply before or during the period of active growth of plants to be controlled. Initial control is enhanced by rainfall.

In areas of low annual rainfall (less than 15 inches per year) Alligare Tebutiuron 80 WG should be applied prior to the time of year when the predominant portion of that rainfall occurs. A minimum of 1 to 1/2 inches of rainfall is required to activate Alligare Tebutiuron 80 WG and place it in the zone of weed seed germination.

Other products registered for use on the site to be treated may be applied in tank mix combination with Alligare Tebutiuron 80 WG to provide broader spectrum weed control or provide initial top kill of existing vegetation. Consult the manufacturer's label for additional weeds controlled, directions for use, cautions and limitations before use. See detailed information for tank mixing in the General Information section of this label.

**Banded Application (Ground Application Only)**

Banded applications of Alligare Tebutiuron 80 WG allow for woody plant control and preservation of grasses and other desirable herbaceous vegetation in rangeland and permanent pastures and in non-ornamental areas (such as utility, railroad, and pipeline rights-of-way and fencerows). In banded applications, the rate per acre is equivalent to the broadcast rate, but the herbicide is concentrated into individual herbicide bands spaced 4 to 10 feet apart. Banded applications may be made using a spray volume of 5 or more gallons per acre. Actual herbicide bands should be kept as narrow as possible during application to minimize potential injury or loss of herbaceous vegetation. In areas such as brush-infested fencerows, a single band may be applied. Control is dependent upon root systems intercepting the herbicide in soil beneath treated bands.

Band spacing should be selected based on the size of the woody plants in the area to be treated and the amount of injury or loss of herbaceous vegetation that can be tolerated. Where control of young or seedling plants is desired, bands should be spaced closer together. This will achieve maximum exposure to their limited root systems. Where larger more mature woody plants are to be controlled, bands should be spaced at the wider end of the recommended spacing range.

In addition to allowing adequate exposure of the more extensive root systems of these larger woody species for control, use of the wider spacings will further reduce injury or loss of herbaceous vegetation within the treated band.

Within the treated band nearly all vegetation, woody and herbaceous, will be killed. Some herbaceous vegetation close to the treated band with roots extending into it may be severely injured or killed. However, since root systems of herbaceous plants are less extensive most plants outside the treated band are unaffected.

When banded applications are made in an area where straight stream nozzles are positioned more than 5 feet above the soil surface or where woody plant foliage is dense, breakup of individual nozzle streams may occur. If conditions do not permit delivery of intact nozzle streams to the soil surface, efficacy may be reduced and injury of herbaceous vegetation will increase. For this reason, application in the dormant season when there is minimum foliage present is recommended. To avoid breakup of individual nozzle streams by interfering vegetation, applicators may also employ mechanical means to position spray nozzles close to the soil surface such as protected drop nozzles mounted at the end of weighted bars which maintain constant contact with the soil surface.

**Fencerow Applications:** For fencerow applications, a single spray band will cover a fencerow 4 to 10 feet wide. Use a rate appropriate to control the most difficult species to control in the fencerow. Use a straight stream nozzle and direct the nozzle stream at the soil surface in the center of the fencerow. For fencerows wider than 10 feet, separate bands may be applied on either side of the fencerow.

**Rate example:** Assuming the desired rate of Alligare Tebutiuron 80 WG is 5 pounds per acre and the fencerow is 10 feet wide, 5 pounds of Alligare Tebutiuron 80 WG will treat 4558 sq ft linear feet of fencerow. Determine the delivery rate for the nozzle at the desired spray pressure and the walking speed of the applicator. If the length of the area to be treated is 4355 ft long and walking speed is 3 mph (264 ft/minute) it would take 16.5 minutes to walk the length of the treatment area. If the delivery rate of the nozzle is 0.6 gallons per minute, the treatment would require approximately 10 gallons (0.6 gallons per minute X 16.5 minutes = 10 gallons) of spray solution.

**Individual Plant Treatment**

**ATTENTION:** Do not use this treatment method in any area where there are desirable species in close proximity to plants to be eliminated. A small amount of Alligare Tebutiuron 80 WG in contact with the roots of desirable trees or other woody species may cause severe injury or death. See Use Precautions and Restrictions section for precautions for avoiding damage to non-target plants.

Alligare Tebutiuron 80 WG may be applied in high or low volumes of water for selective control of individual woody plants. Recommended rates will vary depending upon site conditions, with the higher rates needed for difficult to control species, large plants, heavier soils, fall applications and out brush. Refer to Factors in Herbicidal Response of Woody Plants section for further information.

For high volume applications, mix 1 pound of Alligare Tebutiuron 80 WG in enough water to make 10 gallons of solution. Apply 10 ounces of material to the soil per every 2 to 4 inches of stem diameter.

For low volume applications, mix 1 pound of Alligare Tebutiuron 80 WG in enough water to make 1 gallon of solution. Apply 1 ounce of material to the soil per every 2 to 4 inches of stem diameter.

When treating large stems, apply the multiple treatments (spots or bands) in even spacing around the stem.

Two types of equipment are suggested for applying Alligare Tebutiuron 80 WG using banded or individual plant treatment methods: the Solo Model 425 back pack sprayer (or equivalent) for both banding and individual plant treatment, and the Spot Gun for individual plant treatment.

The Solo sprayer is prepared for spraying by adding the pre-stirred contents of 4 pounds of Alligare Tebutiuron 80 WG and water to the tank. Fill to
capacity with additional water and shake vigorously. Equip the Solo sprayer with a 0003-SS straight stream nozzle and the Solo pressure regulator with the green (10 psi) pressure limiting spring. To band Alligare Tebuethuron 80 WG at 5 pounds per acre, walk at 3 mph (264 feet per minute) with the Solo on continuously and space the bands 5 feet apart. Adjust the rate and walking speed according to the brush species and conditions encountered. For individual plant treatment with the Solo, apply a 1.5 second shot for every 1 to 2 inches of stem diameter at the base of unwanted woody plants.

The Spot Gun is prepared for individual plant treatment by mixing 2 pounds of Alligare Tebuethuron 80 WG in sufficient water to obtain 1 gallon of spray solution. Set the Spot Gun to deliver 8 milliliters of this solution for every 1 to 2 inches of stem diameter at the base of the unwanted woody plants. For application on steep slopes or other sensitive areas, the Spot Gun can be equipped with a soil probe to inject the Alligare Tebuethuron 80 WG solutions beneath the soil surface. Placement at a soil depth of 2 to 4 inches will eliminate any surface movements and reduce injury to herbaceous vegetation. At the prescribed rates, 4 pounds of Alligare Tebuethuron 80 WG will treat approximately 950 stems 1 to 2 inches in diameter. Because of its non-volatile nature and low potential for drift, this Alligare Tebuethuron 80 WG application technique can be used for treating unwanted woody plants in non-cropland areas adjacent to sensitive crops (see Precautions and Restrictions section). Use of a colored marker or dye in spray mixtures will aid in inspection of the completed work.

Aerial Application

Aerial application of Alligare Tebuethuron 80 WG on rights-of-way is limited to helicopter only. Helicopter or fixed-wing aircraft may be used for establishment of herbicidal firebreaks on rangeland or areas adjacent to rights-of-way.

Apply in 5 or more gallons per acre when using aerial application equipment. Because Alligare Tebuethuron 80 WG is a soil active herbicide, maximum soil deposition is desirable. This may be achieved by application of extremely large droplets. Large straight stream nozzles, minimum nozzle pressure and spray thickening agents may be used to achieve the maximum possible droplet size and minimize the potential for drift. Foil deposition from large droplets is also more likely to be washed from foliage to the soil surface during initial rainfall events.

Precautions for Avoiding Spray Drift: Avoid spray drift at the application site. The interaction of many equipment-and-weather-related factors determine the potential for spray drift. Users are responsible for considering all these factors when making decisions.

The following drift management requirements must be followed to avoid off-target drift movement from aerial applications:
1. The distance of the outer most operating nozzles on the boom must not exceed 90% of the wingspan or rotor width.
2. Nozzles must always point backward parallel with the air stream and never be pointed downwards more than 45 degrees.

Where states have more stringent regulations, they should be observed.

Spray Drift Management

Information On Droplet Size: The most effective way to reduce drift potential is to apply large droplets. The best drift management strategy is to apply the largest droplets that provide sufficient coverage and control. Applying larger droplets reduces drift potential, but will not prevent drift if applications are made improperly, or under unfavorable environmental conditions (see Wind, Temperature and Humidity, and Temperature Inversions).

Controlling Droplet Size:
- Volume – Use high flow rate nozzles to apply the highest practical spray volume. Nozzles with higher rated flows produce larger droplets.
- Pressure – Do not exceed the nozzle manufacturer’s recommended pressures. For many nozzle types lower pressure produces larger droplets. When higher flow rates are needed, use higher flow rate nozzles instead of increasing pressure.
- Number of Nozzles – Use the minimum number of nozzles that provide uniform coverage.
- Nozzle Orientation – Orienting nozzles so that the spray is released parallel to the airstream produced larger droplets than other orientations and is the recommended practice. Significant deflection from horizontal will reduce droplet size and increase drift potential.
- Nozzle Type – Use a nozzle type that is designed for the intended application. With most nozzle types, narrower spray angles produce larger droplets. Consider using low-drift nozzles. Solid stream nozzles oriented straight back produce the largest droplets and the lowest drift.

Boom Length: For some use patterns, reducing the effective boom length to less than 90% of the wingspan or rotor length may further reduce drift without reducing swath width.

Application Height: Applications should not be made at a height greater than 10 feet above the top of the largest plants unless a greater height is required for aircraft safety. Making applications at the lowest height that is safe reduces exposure of droplets to evaporation and wind.

Swath Adjustment: When applications are made with a crosswind, the swath will be displaced downwind. Therefore, on the up and downwind edges of the field, the applicator must compensate for this displacement by adjusting the path of the aircraft upwind. Swath adjustment distance should increase, with increasing drift potential (higher wind, smaller drops, etc.).

Wind: Drift potential is lowest between wind speeds of 2-10 mph. However, many factors, including droplet size and equipment type determine drift potential at any given speed. Application should be avoided below 2 mph due to variable wind direction and high inversion potential. NOTE: Local terrain can influence wind patterns. Every applicator should be familiar with local wind patterns and how they affect spray drift.

Temperature and Humidity: When making applications in low relative humidity, set up equipment to produce larger droplets to compensate for evaporation. Droplet evaporation is most severe when conditions are both hot and dry.

Temperature Inversions: Applications should not occur during a local, low level temperature inversion because drift potential is high. Temperature inversions restrict vertical air mixing, which causes small suspended droplets to remain in a concentrated cloud. This cloud can move in unpredictable directions due to the light variable winds common during inversions. Temperature inversions are characterized by increasing temperatures with altitude and are common on nights with limited cloud cover and light to no wind. They begin to form as the sun sets and often continue into the morning. Their presence can be indicated by ground fog; however, if fog is not present, inversions can also be identified by the movement of the smoke from a ground source or an aircraft smoke generator. Smoke that layers and moves laterally in a concentrated cloud (under low wind conditions) indicates an inversion, while smoke that moves upward and rapidly dissipates indicates good vertical air mixing.

Factors In Herbicidal Response of Woody Plants

Alligare Tebuethuron 80 WG has little or no follar activity, but when applied to the soil is readily absorbed by the plant roots along with soil moisture. Effects will not become apparent until there is sufficient rainfall to move the herbicide into the root zone. The time required to achieve control is dependent on soil
type, amount and timing of rainfall, and rooting depth of target species. Some species may go through several defoliations and refoliations over a period of approximately two or three years before dying.

**Soil Texture, Soil Depth, and Organic Matter**
Poor control or erratic results are likely to occur if banded treatments are applied to soils containing more than 5% organic matter or more than 30% clay. Do not apply to “blackland” or other heavy clay soils that crack extensively upon drying. Other deep, medium, and fine-textured soils supporting deep-rooted woody plant species require higher rates within rate ranges for consistent control. Woody plants growing in shallow, coarse, or rocky soils with low organic matter are normally more susceptible due to increased soil availability of the herbicide and shallow rooting depth. Application rates at the low end of this rate range may be used under these conditions.

**Woody Plant Size and Density**
The height and density of woody vegetation is a reliable indicator of soil conditions. Woody vegetation is generally taller and denser where soils are deep and/or of medium to fine texture and where soil moisture conditions are more favorable. Higher rates in the rate range are required on such sites. Woody vegetation will be smaller and less dense on sites with coarse, shallow, or rocky soils with less favorable soil moisture conditions. Lower rates in the range may be used on such sites. Where a high level of woody plant control is required and application rates cannot be adjusted for changes in soils, plant size, or density, apply Alligare Tebuthiuron 80 WG at a rate sufficient to control the tallest and most dense woody vegetation in the treatment area.

**Application Timing**
Alligare Tebuthiuron 80 WG may be applied anytime except when the soil is frozen or is saturated with moisture. For optimum results, applications should be made prior to the resumption of active seasonal growth in the spring or before expected seasonal rainfall. In areas receiving greater than 25 inches of annual rainfall, late summer and fall applications may require a higher application rate in the indicated rate range to achieve consistent control.

Banded application of Alligare Tebuthiuron 80 WG is recommended for control of brush regrowth after dozing or shredding, provided the regrowth has reached an average height of five feet or more prior to application. Alligare Tebuthiuron 80 WG works best when there is an abundance of active leaf area to stimulate soil moisture and herbicide uptake during the season following application. Taller regrowth will tend to respond with faster and more consistent brush control.

Alligare Tebuthiuron 80 WG may cause temporary herbicidal symptoms to appear on perennial grasses. Dormant season application is recommended to minimize herbicidal effects on desirable forage grasses.

**Effect of Shallow Groundwater on Woody Plant Control**
Do not apply Alligare Tebuthiuron 80 WG to areas where the water table is predominantly shallow (5 feet or less), such as marshy or sub-irrigated areas, or areas immediately adjacent to streams or lakes which are periodically flooded. On such sites, where roots extend directly to a shallow water table, woody plants are minimally affected by applications of tebuthiuron and poor control will result.

**Grazing Management**
In rangelands and permanent grass pastures, measures to minimize injury to, and maximize growth response of, desirable grasses and other forage species are recommended. These include:
- application during seasons when forage species are not actively growing,
- application in narrow bands using straight stream nozzles to minimize potential injury to desirable herbaceous cover, and,
- utilizing the maximum width between bands that will still allow for optimal woody plant control (refer also to the General Information section above).

For optimum perennial forage grass response, desirable species should be present in the area to be treated at a minimum of 10% of normal plant density (density = plants per unit area) compared to similar rangeland or pasture sites not dominated by woody plants. To encourage forage response, grazing should be deferred during the entire active growing season following application. Poor vegetative vigor or inadequate rainfall may necessitate additional grazing deferment during periods of active forage growth. Light to moderate grazing after forage grasses are mature and seed has set will not harm grasses and can aid in seed dispersal. Forage grass production usually increases as woody plant competition for water and nutrients is reduced. However, increased forage production is also dependent on adequate rainfall and a sound grazing management program.

**Woody Plants in Rangeland, Permanent Pastures and Fencerows Controlled by Banded Applications**

**Apply Alligare Tebuthiuron 80 WG at 0.95 to 1.25 lb per acre on the following woody plant species:**

**Apply Alligare Tebuthiuron 80 WG at 0.63 to 2.5 lb per acre on the following woody plant species:**

<table>
<thead>
<tr>
<th>Common Name</th>
<th>Scientific Name</th>
</tr>
</thead>
<tbody>
<tr>
<td>oak, sand shinnery</td>
<td>Quercus havardii</td>
</tr>
</tbody>
</table>

(Note: A wide range is provided to accommodate the broad range of soil and climatic variations which occurs in areas occupied by sand shinnery. Use the lowest application rate only on shallow sands in southern part of species range or where partial control is desired. Use a higher dose in indicated rate range for deeper sands and dunes, and on shinnery varieties with tall and dense growth habit which become more prevalent in the mid-to-northern part of the species range (see Factors in Herbicidal Response of Woody Plants section of this label).)

**WOODY PLANT CONTROL IN RANGELAND, PERMANENT PASTURES, FENCEROWS AND CLEARINGS FOR WILDLIFE HABITAT**
Alligare Tebuthiuron 80 WG is recommended as a ground-applied band application for control of woody plants in rangeland and permanent pastures, for establishment of clearings for enhancement of wildlife habitat, and for control of trees and brush in fencerows.

**Apply Alligare Tebuthiuron 80 WG at 0.95 to 1.25 lb per acre on the following woody plant species:**

<table>
<thead>
<tr>
<th>Common Name</th>

ESTABLISHMENT OF HERBICIDAL FIREBREAKS

Alligare Tebuthiuron 80 WG may be used for establishment of firebreaks in annual grasslands adjacent to frequently traveled areas or areas with a history of repeated wildfires. Application of Alligare Tebuthiuron 80 WG provides residual preemergence control of annual grasses and broadleaf weeds and prevents annual buildup of combustible fuel. Treated strips 40 to 50 feet wide may be established parallel to highways or frequently traveled areas or in a broad-scale grid pattern. Strategic placement of firebreaks can prevent fires from spreading from frequently traveled areas or lightning fires can be confined to the area within a single grid block. Herbicidal firebreaks can also serve as a means of safe passage in case of entrapment during fire-fighting efforts.
This practice is intended for use in rangelands dominated by annual grasses such as *Bromus* and other annual grass species and certain broadleaf weeds prevalent in the Great Basin and Pacific Northwest. When surface applied from mid-summer to early fall, Alligare Tebuthuron 80 WG provides residual preemergence control of susceptible annual grasses and broadleaf weeds from early fall through the spring growth period. Depending on application rate, a single application may provide effective annual grass and broadleaf control for 2 years or more. Desirable perennial grasses within treated strips may be temporarily injured, but if not overgrazed, will increase in vigor and density with time.

**Annual Weeds Controlled:** Includes *Bromus spp.*, downy brome-grass or cheatgrass (*Bromus tectorum*), ripgut brome (*Bromus diandrus*), annual mustards, bur buttercup (*Ranunculus sceleratus*) and other annual species.

**Application Timing:** Alligare Tebuthuron 80 WG may be applied from mid-summer through early fall (July 15 through October 15). Application should occur prior to or immediately after the onset of germination of target annual weeds. Alligare Tebuthuron 80 WG may be applied 2 to 3 months before germination of target weeds without loss of herbicidal activity. The treatment becomes herbicidally active when there is sufficient rainfall to move the herbicide into the surface soil where germination occurs. Control will be reduced if Alligare Tebuthuron 80 WG is applied after the root systems of target weeds are established and can obtain soil moisture below the zone of herbicidally active surface soil.

**Broadcast Application Rates:** Apply Alligare Tebuthuron 80 WG at a rate of 0.38 to 0.75 lb/acre (0.3 to 0.6 lb a.i./acre) in a minimum spray volume of 5 gallons per acre for ground equipment. Use low pressure large droplet herbicide nozzles. Use the lower end of the rate range in areas with coarse to medium textured soils with low organic matter and the higher end of the rate range in areas with medium to fine textured soils, areas with higher organic matter, or where a longer period of control is desired.

**Woody plant control:** With time, application rates greater than 0.4 lb/acre of Alligare Tebuthuron 80 WG may provide sagebrush control within treated strips.

**Application Techniques and Equipment:** Herbicidal firebreaks may be applied with ground equipment. Ground equipment using cluster nozzles may be preferable to conventional ground spray nozzles in areas of rough terrain. Adjust spray boom to deliver a uniform swath approximately 40-50 feet wide. Treat strips of sufficient width to contain a wild fire in annual grass vegetation normally observed in the area.

Repeat applications may be made at a reduced rate within previously treated strips or application may occur adjacent to treated strips to widen the zone of reduced fuel in case of fire. By treating strips adjacent to previously treated strips, desirable changes in herbaceous perennial vegetation within previously treated strips may be preserved.

**NON-CROPLAND TOTAL VEGETATION CONTROL**

Alligare Tebuthuron 80 WG may be used for preemergence and postemergence total vegetation control in such non-cropland areas as: airport runways, utility substations and rights-of-way, road shoulders where no vegetation is desired, under asphalt and concrete pavements where no future landscaping is planned, at the base of highway guardrails, sign posts and markers, at the base of transmission towers and poles, along industrial buildings, lumberyards, railroad yards, firebreaks, and fencerows.

Note: Refer to General Information section for limitations on maximum use rates, frequency of application and total application rates allowed during a given period of time. Refer to the Restrictions for Ground Water Protection under the Environmental Hazards section for other rate limitations on "vulnerable" sites.

For total vegetation control in areas not treated the previous season with tebuthion or other residual herbicides, apply Alligare Tebuthuron 80 WG prior to or just after emergence of plants as follows:

**At 5 pounds per acre, Alligare Tebuthuron 80 WG will control the following:**

- Alfalfa
- Aster, heath
- Aster, white heath
- Barley, little
- Bedstraw
- Bluegrass, annual
- Bluegrass, Kentucky
- Bouncingbet
- Brome-grass, downy
- Brome-grass, ripgut
- Brome-grass, smooth
- Broomsedge
- Buffalograss
- Burclover
- Buttercup, smallflower
- Camphorweed
- Carrot, wild
- Catsear, spotted
- Cheat
- Chickweed
- Clover, red
- Cocklebur
- Creeping, Virginia
- Crowdfootgrass
- Dock, curly
- Dogfennel
- Fescue
- Fescue, rattle
- Fiddleneck, coast
- Fireweed
- Fother, redstem
- Fleabane, annual
- Foxtail
- Gaillardia, rosering
- Geranium, Carolina
- Goldenrod
- Grape
- Gumweed

- Hemlock, poison
- Henbit
- Honeysuckle, Japanese
- Horseweed
- Kochia
- Lambsquarters
- Lupine
- Medic, black
- Morningglory
- Mullein, common
- Nightshade, silverleaf
- Oat, wild
- Panicum, Texas
- Pepperweed, Virginia
- Pigweed
- Plantain, buckhorn
- Punchcurevine
- Ragweed, giant
- Raspberry, red
- Ryegrass, Italian
- Sedge, annual
- Shepherdspurse
- Sida, prickly
- Spotted, nodding
- Spikerweed
- Spurge
- Spurge, spotted
- Starthistle, yellow
- Strawberry
- Sunflower, common
- Telegraphplant
- Timothy
- Trumpetcreeper
- Velvetgrass
- Withgrass

**For the maintenance of total vegetation control in non-cropland areas east of the Rocky Mountains which were treated the previous season with tebuthion or other residual herbicides, apply Alligare Tebuthuron 80 WG prior to or just after emergence of plants as follows (some of the species listed may show erratic control depending on the time between applications and weed germination):**

**At 3 pounds per acre, Alligare Tebuthuron 80 WG will control the following:**

- Goldenrod

**At 2 pounds per acre, Alligare Tebuthuron 80 WG will control the following:**

- Bluegrass, annual
- Bluegrass, Kentucky
- Carrot, wild
- Chickweed, common
- Convolvulus
- Fleabane, annual

- Parsnip, wild
- Pepperweed
- Pigweed
- Ragweed, common
- Smartweed, Pennsylvania
- Sweetclover
Horseweed
Thistle, Canada
Mullein
Wood sorrel, yellow
Panicum, tall

In areas of rainfall greater than 25 inches per year, the 3 pounds per acre maintenance rate should be used for all weed species listed above.

For the maintenance of total vegetation control in non-cropland areas west of the Rocky Mountains which were treated the previous season with tebuthiuron or other residual herbicides, apply Alligare Tebuthiuron 80 WG prior to or just after emergence of plants as follows (some of the species listed may show erratic control depending on the time between applications and weed germination):

At 1.5 pounds per acre, Alligare Tebuthiuron 80 WG will control the following:

Bassia, fivehook
Pigweed
Cheat
Plantain
Cudweed
Rye grass, annual
Foxtail
Saltbrush
Lettuce, prickly
Shepherdspurse
Oat, wild
Witchgrass

game
Cotter, bristly

At 2 pounds per acre, Alligare Tebuthiuron 80 WG will control the following:

Buttercup
Mustard
Canarygrass, reed
Ragweed, western
Knapweed, Russian
Starthistle, yellow
Knotweed
Telegraphplant
Mallow

At 3 pounds per acre, Alligare Tebuthiuron 80 WG will control the following:

Barley
Sida, alkali
Gumweed
Smartweed, swamp
Puncturevine

In areas of rainfall greater than 25 inches per year, the 3 pounds per acre maintenance rate should be used for all weed species listed above.

NON-CROPLAND CONTROL OF WOODY PLANTS AND VINES

For the control of woody plants and vines, apply the following rates of Alligare Tebuthiuron 80 WG. These rates can vary depending upon soil type, rainfall, time of application and size/density of the woody plants.

Apply Alligare Tebuthiuron 80 WG at 1.25 to 2.5 lb per acre on the following woody plant species:

Common Name
Scientific Name
Burrweed
Haploppappus tenusetus
Creosotebush
Larrea tridentata
Wait-a-minute-bush
Mimosa biuncifera

In addition to those species controlled at 1.25 lb per acre, the following species will be controlled at the rate of 2.5 lb per acre:

Common Name
Scientific Name
Blueberry
Vaccinium spp.
Buckbrush
Symphoricarpus orbicularis
Ceniza (Texas silverleaf)
Leucothoryum frutescens
Cherry, bitter
Prunus emarginata
Elm, American
Ulmus americana
Hackberry, western
 Celtis occidentalis
Huckleberry
Gaylussacia spp.
Locust, black
Robinia pseudoacacia
Pine
Pinus spp.
Pine, western white
Pinus monticola
Rose, multiflora
Rosa multiflora
Sage, purple
Salvia leucophylla
Sagebrush, big
Artemisia tridentata
Sunmack, smooth
Rhus glabra
Thornapple, desert
Datura stramonium
Tree-of-heaven
Allanthus altissima
Whitebrush
Alyssia chrysoides
Woolberry, badlander
Lythrum benardieri

In addition to those species controlled at 2.5 lb per acre, the following species will be controlled at the rate of 3.75 lb per acre:

Common Name
Scientific Name
Akler, speckled
Beilula populifolia
Birch, gray
Populus deltoides
Cottonwood, eastern
Ulmus alata
Elm, winged
Ableilas balsamea
Graneno
Celtis pallid
Herdbuck
Spiraea tomentosa
Huisache
Acacia farnesiana
Condalia, lotebush
Condalia obscurifolia
Maple, sugar
Acer saccharum
Oak, blackjack
Quercus marilandica
Oak, blue
Quercus douglasii
Oak, post
Quercus stellat
Poplar, balsam
Populus balsamifera
Spruce, white
Picea glauca
Tamarack
Larix laricina
Willow
Salix spp.
Yaukon
Ilex vomitoria
Yuapaon
Schaefferia cuneifolia

In addition to those species controlled at 3.75 lb per acre, the following species will be controlled at the rate of 5 lb per acre:

Common Name
Scientific Name
Acacia, blackbrush
Acacia rigidula
Acacia, catalay
Acacia greggi
Acacia, twisted
Acacia tortosa
Alder, red
Alnus rubra
Aspen, bigtooth
Populus grandidentata
Beech, American
Fagus grandifolia
Blackberry, Allegheny
Rubus allegheniensis
Boxelder
Acer negundo
Chamise
Adenostoma fasciulatum
Chokecherry, common
Prunus virginiana
Columbina, Texas
Colubrina texensis
Condalia, bluewood
Condalia obovala
Creeper, Virginia
Parrhenocissus quinquefolia
Dogwood, roughleaf
Cornus drummondii
Douglas fir
Pseudotsuga menziesii
Guajillo
Craetaegus spp.
Guayacan
Carya texana
Hawthorn
Carya glabra
Hickory, black
Carya ovata
Hickory, pignut
Carya oxima
Hickory, snagbark
Carya laciniosa
Kidneywood, Texas
Carya flava
Kuztu
Carya alba

9
Leatherstem
Maple
Mountain-mahogany (birchlea)
Oak, California scrub
Oak, live
Oak, pin
Oak, red
Oak, white
Pine, Australian
Pines
Salvia, shrubby blue
Sumac, staghorne
Sweetgum
Trumpet creeper

**Individual (Spot) Application**

Alligare Tebuthiuron 80 WG may be applied, using hand-held equipment at up to 7.5 pounds per acre, to the following species by individual (spot) application only:

<table>

**STORAGE AND DISPOSAL**

Do not contaminate water, food or feed by storage and disposal.

**Pesticide Storage:** The herbical properties of Alligare Tebuthiuron 80 WG require caution in handling, storage, and transportation of this product. Store in original container only. In case of leak or spill, contain material and dispose as waste.

**Pesticide Disposal:** Open dumping is prohibited. Wastes resulting from the use of this product must be disposed of on site or at an approved waste disposal facility.

**Container Disposal:** Nonrefillable container. Do not reuse or refill this container. Completely empty bag into application equipment. Then offer for recycling, if available, or dispose of empty bag in a sanitary landfill or by incineration, or if allowed by state and local authorities, by burning. If burned, stay out of smoke.

**CONDITION OF SALE AND LIMITATION OF WARRANTY AND LIABILITY**

To the extent consistent with applicable law, upon purchase or use of this product, purchaser and user agree to the following terms:

**Warranty:** Alligare, LLC (the Company) warrants that this product conforms to the chemical description on the label in all material respects and is reasonably fit for the purpose referred to in the directions for use, subject to the exceptions noted below, which are beyond the Company's control. To the extent consistent with applicable law, the Company makes no other representation or warranty, express or implied, concerning the product, including no implied warranty of merchantability or fitness for a particular purpose. To the extent consistent with applicable law, no such warranty shall be implied by law, and no agent or representative is authorized to make any such warranty on the Company's behalf.

**Terms of Sale:** The Company's directions for use of this product must be followed carefully. It is impossible to eliminate all risks inherently associated with use of this product. Crop injury, ineffectiveness or other unintended consequences may result because of such factors as weather conditions, presence of other materials, and the manner of use or application (including failure to adhere to label directions), all of which are beyond the Company's control. To the extent consistent with applicable law, all such risks are assumed by the user.

**Limitation of Liability:** To the extent consistent with applicable law, the exclusive remedy against the Company for any cause of action relating to the handling or use of this product is a claim for damages, and in no event shall damages or any other recovery of any kind exceed the price of the product which caused the alleged loss, damage, injury or other claim. To the extent consistent with applicable law, under no circumstances shall the Company be liable for any special, indirect, incidental or consequential damages of any kind, including loss of profits or income. Some states do not allow the exclusion or limitation of incidental or consequential damages. The Company and the seller offer this product, and the purchaser and user accept this product, subject to the foregoing warranty, terms of sale and limitation of liability, which may be varied or modified only by an agreement in writing signed on behalf of the Company by an authorized representative.

EPA 20900421
ALLIGARE
TEBUTHIURON 80 WG

A Herbicide for preemergence and postemergence use. Controls woody plant species, brush and weeds on noncrop areas, including rangeland, permanent grass pastures, fencerows, and clearings for wildlife habitat.

Not for sale, distribution, or use in Nassau or Suffolk counties in New York State. Alligare Tebuthiuron 80 WG will kill trees and shrubs. Carefully read the precautions before using.

ACTIVE INGREDIENT:
Tebuthiuron: N-[5-(1,1-dimethylethyl)-1,3,4-thiadiazol-2-yl]-N'-dimethylurea .................................................. 80.0%
OTHER INGREDIENTS: ..................................................................................................................... 20.0%
TOTAL: ........................................................................................................................................ 100.0%
Contains 20 pounds active ingredient per 25 pound bag

EPA Reg. No. 81927-37  EPA Est. No. 11603-IGR-001™; 81927-AL-001™
39578-TX-001™; 5905-IA-001™
Letter(s) in lot number correspond(s) to superscript in EPA Est. No.

KEEP OUT OF REACH OF CHILDREN
CAUTION / PRECAUCIÓN

Si usted no entiende la etiqueta, busque a alguien para que se la explique a usted en detalle. (If you do not understand the label, find someone to explain it to you in detail.)

STORAGE AND DISPOSAL

Do not contaminate water, food or feed by storage and disposal.
Pesticide Storage: The herbicidal properties of Alligare Tebuthiuron 80 WG require caution in handling, storage, and transportation of this product. Store in original container only. In case of leak or spill, contain material and dispose as waste.
Pesticide Disposal: Open dumping is prohibited. Wastes resulting from the use of this product must be disposed of on site or at an approved waste disposal facility.
Container Disposal: Nonrefillable container. Do not reuse or refill this container. Completely empty bag into application equipment. Then offer for recycling, if available, or dispose of empty bag in a sanitary landfill or by incineration, or if allowed by state and local authorities, by burning. If burned, stay out of smoke.

See label booklet for First Aid, additional Precautionary Statements and Directions for Use.
