Fungicide for Postharvest Pome Fruit Treatment by Thermal Fogging

**FUNGICIDE RISK MANAGEMENT**

- **Risk Characterization:** Fludioxonil is a fungicide that is in the phenylpyrrole class of chemistry and has a unique mode of action, which leads to increased glycerol production in the fungus. Fungal isolates with acquired resistance to Group 12 will eventually dominate the fungal population if Group 12 fungicides are used repeatedly in the same packing house or in successive years as the primary method of control for targeted pathogens. This may result in partial to total loss of control by those fungicides or other Group 12 fungicides. Resistance development cannot be prevented by any fungicide program and resistance management practices are necessary to ensure the long-term effectiveness for decay control.

**Action Ranges and Dilutions**

- **Fludioxonil (As Fludioxonil**)
  - **Preparation for Fogging:** A total of at least 7 feet and no more than 15 feet shall be present between each of the treated fruit.
  - **Dosage:** 100 to 1000 ppm, with the lowest dosage recommended for application to all areas of the treatment chamber. The dosage of eFOG should be integrated into the specified eFOG dosage for the given application.
  - **Application Rate:** Apply 300 to 600 milliliters of eFOG per cubic meter (2200 to 4500 ppm) of fruit (approximately 3 gallons per ton of fruit). The application rate will vary depending on the size of the chamber and the expected fog drift.
