Because subterranean termites are cold-blooded (poikilothermic) animals, low temperatures can substantially reduce or stop their activity close to the earth’s surface during a certain period of the year. For this reason, if the temperature falls low enough, termites may cease to feed in stations or the onset of feeding in stations may be delayed until temperatures have recovered above a certain level for a long enough period of time. Reductions in termite activity that are the result of low temperatures may make inspections of stations unnecessary for as long as low temperatures prevail in the area.

The temperature at which termite activity is substantially curtailed may vary significantly between different geographic areas and with different species of termites. However, generally speaking, termite activity will be reduced in the stations during those times of the year during which the average daily mean exterior air temperature is below 50°F. The operator should always make allowances for local circumstances when considering increasing elapsed time between inspections. Under no circumstances should more than 6 months elapse between inspections of stations.

Allowing extra time between inspections may not be advisable if stations are located in an area in or under a structure in which the average daily mean air temperature is expected to remain above 50°F and termites are actively consuming bait in the stations. Inspection intervals must comply with state regulations, where applicable.

**Supplemental Treatment**

This product can be applied or used as a supplemental treatment in, underneath, and/or around structures or buildings to kill termites in support of, or as a supplement to, a termiticide product labeled for and applied as a stand-alone termiticide treatment. This includes pre-construction and post-construction soil termiticide treatments labeled for providing structural protection. This product may also be used in combination with an additional termiticide treatment, as a supplemental treatment in areas not associated with structures or buildings, such as around trees, wood piles, landscaping elements, railroad track beds, and other areas where termite activity is known or suspected.

To provide a supplemental bait treatment, install one or more bait station(s), in the soil at or near points of known or suspected termite activity. Insert bait into the station(s) at the time of installation (direct baiting) or when termites are detected in or near a station. Baiting may be discontinued at any time at the discretion of the applicator. Inspect stations every 120 days or 4 months. After feeding has stopped, and there has been no activity for one year, inspect the stations every 6 months. If activity returns, place bait in the active station(s) and inspect every 120 days or 4 months. Stations may be inspected more frequently (additional inspections) than prescribed, if desired.

**Non-structure Spot Treatment**

This product can also be applied or used as a spot treatment in areas not associated with structures or buildings, such as around trees, wood piles, landscaping elements, railroad track beds, and other areas where termite activity is known or suspected. Such treatments may be made alone or in combination with an additional termiticide treatment. Installation, baiting, and inspecting of spot bait treatments made with this product should follow directions provided in the Supplemental Treatment section.

**Conditions of Sale and Warranty**

The Directions For Use of this product reflect the opinion of experts based on field use and tests. The directions are believed to be reliable and must be followed carefully. However, it is impossible to eliminate all risks inherently associated with the use of this product. Ineffectiveness or other unintended consequences may result because of such factors as environmental conditions, presence of other materials, or use of the product in a manner inconsistent with its labeling, all of which are beyond the control of BASF CORPORATION (“BASF”) or the Seller. To the extent consistent with applicable law, all such risks shall be assumed by the Buyer. BASF warrants that this product conforms to the chemical description on the label and is reasonably fit for the purposes referred to in the Directions For Use, subject to the inherent risks, referred to above.

To the extent consistent with applicable law, (A) BASF MAKES NO OTHER WARRANTIES EXPRESS OR IMPLIED, INCLUDING WARRANTIES OF FITNESS FOR PARTICULAR PURPOSE OR MERCHANTABILITY, (B) BUYER’S EXCLUSIVE REMEDY AND BASF’S AND SELLER’S EXCLUSIVE LIABILITY, WHETHER IN CONTRACT, TORT, NEGLIGENCE, STRICT LIABILITY, OR OTHERWISE, SHALL BE LIMITED TO REPAYMENT OF THE PURCHASE PRICE OF THE PRODUCT, AND (C) BASF AND THE SELLER DISCLAIM ANY LIABILITY FOR CONSEQUENTIAL, INCIDENTAL, SPECIAL OR INDIRECT DAMAGES RESULTING FROM THE USE OR HANDLING OF THIS PRODUCT. BASF and the Seller offer this product, and the Buyer and User accept it, subject to these Conditions of Sale and Warranty which may be varied only by agreement in writing signed by a duly authorized representative of BASF.

**Precautionary Statements**

**Environmental Hazards**

This product is highly toxic to aquatic invertebrates. **DO NOT** place this product in any area where, because of the movement of water, it could be washed into a body of water containing aquatic life such as ponds or streams.

**Important:** Before buying or using this product, read the entire label including the Conditions of Sale and Warranty. If terms are not acceptable, return the unopened product container at once. Use this product only according to label directions.

Directions For Use

It is a violation of federal law to use this product in a manner inconsistent with its labeling.

Read the Product Information and Use Directions carefully before using. This product is intended for use in BASF approved bait stations which may be purchased from most professional pest control product distributors. Use of this product in any other type of station not approved by BASF is prohibited. Contact BASF at 1-800-777-8570 for assistance in using this product.

STORAGE AND DISPOSAL

DO NOT contaminate water, food, or feed by storage or disposal.

Pesticide Storage

Store in original container in a dry storage area out of reach of children and animals.

Pesticide Disposal

Product not disposed of by use according to label directions should be wrapped in paper and placed in a trash can. If these wastes cannot be disposed of according to label instructions, contact your State Pesticide or Environmental Control Agency, or the Hazardous Waste representative at the nearest EPA Regional Office for guidance.

Container Handling

Nonrefillable container. DO NOT reuse or refill this container. Offer for recycling if available. If recycling is not available, place container in trash.

In Case of Emergency

In case of large-scale spill of this product, call:

- CHEMTREC 1-800-424-9300
- BASF Corporation 1-800-832-HELP (4357)

In case of medical emergency regarding this product, call:

- Your local doctor for immediate treatment
- Your local poison control center (hospital)
- BASF Corporation 1-800-832-HELP (4357)

Product Information

The active ingredient, diflubenzuron, is an insect development inhibitor. When consumed by a termite, diflubenzuron impairs the ability of the termite to properly synthesize chitin and inhibits the termite’s ability to molt. Molting is the process by which termites, at certain points in their development, shed their existing exoskeleton and form a replacement exoskeleton. Termites that attempt to molt after ingesting an amount of product sufficient to impair their molting process either die or are incapacitated by their inability to complete the molting process. Insect development inhibitors such as diflubenzuron are characterized as slow acting toxicants, however their action is slow only when they affect a termite at the point in its life cycle when it molts. Because all the termites in a colony do not molt at the same time, the effect of diflubenzuron on the colony as a whole is progressive. This progressive effect is one of the key attributes of diflubenzuron as a termite colony toxicant. Sufficient consumption of this product by a termite colony can cause a decline in the number of members of the colony. Such a decline, if sustained by continued consumption of this product by the colony, can significantly impair the vitality of the colony. Further, continued consumption of this product by remaining colony members may gradually inhibit molting and cause the colony to go into a state of stasis.

Use Directions

This product is intended for use in managing subterranean termite colonies in the ground around and under any type of building object (structure). It does not exclude termites from a structure. Instead, it suppresses or eliminates termite colonies. Sufficient consumption of this product by all subterranean termite colonies that present an existing or potential hazard to the structure may, subject to the limitations stated herein, protect the structure against subterranean termite attack.

This product affects termite colonies only if they consume it. Pre-baiting is a process by which termite activity is established at a location prior to the application of this product at that location. However, once they have consumed the pre-bait, termites can normally be induced to consume this product. These termites then attract other colony members to the bait station where they also consume this product. After termite activity has been absent from a station for approximately 60 days, any remaining bait may be removed. If bait is removed, clean out station and replace with pre-bait or bait. After pre-baiting, bait may remain in the station if it is in good condition and ≥50% remains. If termites have abandoned the station, possibly due to reductions in termite activity related to low temperatures during the period of predicated limited termite activity (see Adjustments to Inspection Scheduling), it may be advisable to leave the station and bait in place and recheck the station again after the period of predicted limited termite activity has elapsed before removing and replacing the bait. If termites have abandoned the station possibly due to excessive moisture, it may be advisable to remove the saturated bait and re-bait the station with fresh bait at that time or after the excess moisture has abated.

Station Preparation and Location Selection

To reduce the potential for tampering with and disturbance of points, stations of point installation should be chosen that, where possible, minimize installed station visibility. Areas where barrier type termiticides may have previously been applied, such as within 2 feet of the foundation wall, should be avoided if possible.

Install stations at or near points of known or suspected termite entry into the structure. If a point of accessible ground is located within 10 feet of a point of known termite entry (due to an intervening hardened construction surface such as a concrete slab), it may be advisable to create an access to the ground through that surface close to the point of known entry and install stations at that location.

Install stations at, or preferably within, approximately 5 feet of points of known, probable, or suspected termite foraging and at other critical areas. Such areas may include areas with connections or openings in the foundation or exterior wall such as in wood scraps, in contact with the ground, areas of soil moisture, damaged areas, areas containing plant root systems, bath traps, visible termite foraging tubes, etc.

Inspecting a Station and Placing Bait

To inspect a station, remove the cover and visually examine the interior for the presence of termites, being careful to minimize disturbance of the termites. If live termites are present in the station, bait with this product. If it appears, upon reinspection, that ≥50% of the bait has been consumed it may be advisable to replace the bait. If termites are not present, further inspect the station for moisture saturation, and replace the saturated bait with fresh bait. Replace excessively decayed bait or pre-bait. Replace the station cover securely.

Scheduling of Inspections

If termite activity is known to be present in or on the structure at the time the stations are initially installed, inspect all stations two times at approximately 60 and 120 days after the date of completion of initial station installation. If no termite activity is present in or on the structure at the time the stations are initially installed, inspect all stations for the first time approximately 120 days after the date of completion of initial station installation. Thereafter, inspect stations approximately 120 days after the date of the last inspection of the stations.

Adjustments to Inspection Scheduling

Increases in elapsed time between inspections of a baited station may be warranted if consumption of all the bait in the station occurs during the interval between any two inspections.
Compressed Termite Bait II

- Termite Bait Cartridge (TBC)
- For use by individuals/firms licensed or registered by the state to apply termiticide products. States may have more restrictive requirements regarding qualifications of persons using this product. Consult the structural pest control regulatory agency of your state prior to use of this product.
