(1) TAPOUT® is not for use on vegetable crops being grown for seed production unless specific use directions are provided.
(2) See annual and perennial grass control tables for specific use rate.
(3) Non-ionic surfactant (NIS) in this case refers to an adjuvant containing at least 80% non-ionic surfactant such as Helena’s Induce. Crop oil concentrate in this case refers to both crop oil concentrate and crop oil concentrate blends. Acceptable crop oil concentrates would be those that contain a minimum of 80% oils and 15% emulsifier, such as Helena’s Agridex. Acceptable crop oil concentrates would be those that contain a minimum of 60% oils and 25-40% surfactants and emulsifiers such as Helena’s Dyne-Amic. A crop oil concentrate must contain either a petroleum or vegetable oil base and must meet all the following criteria: be non-phytotoxic, contain only EPA-exempt ingredients, provide good mixing quality and be successful in local experience. Highly refined vegetable oils have proven more satisfactory than unrefined vegetable oils.
(4) Use a spray grade ammonium sulfate or AMS replacement such as Helena’s Quest. The use of ammonium sulfate or AMS replacement does not take the place of the required adjuvant.

### USE DIRECTIONS FOR BUSHBERRY, CANEBERRY AND PEACH

Apply TAPOUT® postemergence to actively growing grasses according to rate table. Crop injury to bushberry, caneberry and peach can occur if TAPOUT® is improperly applied. TAPOUT® should not be applied directly over the top of these plant types. Instead spray should be directed at the base of the plant where grassy weeds are growing near the ground.

Do not apply TAPOUT® to Bushberry, Caneberry or Peach grown for root stock.

Non-bearing fruit and nut crops are plants which will not bear fruit or nuts for at least one year following TAPOUT® application.
