INSECTICIDE

• Take off contaminated clothing.

INSECTICIDE

Follow manufacturer’s instructions for cleaning/maintaining PPE. If no such instructions for washables, use detergent and hot water. Keep and wash PPE separately from other laundry.

Engineering Control Statements

When handlers use closed systems or enclosed cabs, or aircraft in a manner that meets the requirements listed in the Worker Protection Standard (WPS) for agricultural pesticides (40 CFR 170.240)(414-6), the handler PPE requirements may be reduced or modified as specified in the WPS.

User Safety Recommendations

Users should:
• Wash hands before eating, drinking, chewing gum, using tobacco or using the toilet.
• Remove clothing/PPE immediately if pesticide gets inside. Then wash thoroughly and put on clean clothing.
• Remove PPE immediately after handling this product. Wash the inside of gloves before removing. As soon as possible, wash thoroughly and change into clean clothing.

ENVIRONMENTAL HAZARDS

This product is highly toxic to bees and other pollinating insects exposed to direct treatment or to residues in/on blooming crops or weeds. Protect pollinating insects by following label directions intended to minimize drift and to reduce risk to these organisms.

DO NOT apply directly to water, or to areas where water surface is present or to intertidal areas below the mean high water mark. DO NOT contaminate water when disposing of equipment washwater or rinsate. DO NOT apply when weather conditions favor drift from treated areas.

AVOIDING SPRAY DRIFT AT THE APPLICATION SITE IS THE RESPONSIBILITY OF THE APPLICATOR. The interaction of many equipment and weather-related factors determine the potential for spray drift. The applicator is responsible for considering all these factors when making decisions. Where states have more stringent regulations, they must be observed.

DIRECTIONS FOR USE

It is a violation of Federal law to use this product in a manner inconsistent with its labeling. DO NOT apply this product in a way that will contact workers or other persons, either directly or through drift. Only protected handlers may be in the area during application. For any requirements specific to your State or Tribe, consult the agency responsible for pesticide regulation.

AGRICULTURAL USE REQUIREMENTS

Use this product only in accordance with its labeling and with the Worker Protection Standard, 40 CFR Part 170. This Standard contains requirements for the protection of agricultural workers on farms, forests, nurseries, and greenhouses and handlers of agricultural pesticides. It contains requirements for training, decontamination, notification, and emergency assistance. It also contains specific instructions and exceptions pertaining to the statements on this label about personal protective equipment (PPE), and restricted-entry interval. The requirements in this box only apply to uses of this product that are covered by the Worker Protection Standard.

DO NOT enter or allow worker entry into treated areas during the Restricted Entry Interval (REI) of twelve (12) hours.

PPE required for early entry into treated areas that is permitted under the Worker Protection Standard that involves contact with anything that has been treated, such as plants, soil, or water, are: coveralls, chemical resistant gloves made of waterproof material (such as, barrier laminate, butyl rubber, nitrile rubber, neoprene rubber, polyvinyl chloride or vinyl), and shoes plus socks.

Commercial greenhouses and nurseries are within the scope of the Worker Protection Standard.

FAILURE TO FOLLOW THE USE DIRECTIONS AND PRECAUTIONS ON THIS LABEL MAY RESULT IN PLANT INJURY OR POOR PEST CONTROL. Product Restrictions: Not for residential use.

PRECAUTIONARY STATEMENTS

HAZARDS TO HUMANS AND DOMESTIC ANIMALS

CAUTION

Harmful if swallowed or absorbed through skin. Avoid contact with skin or clothing. Wash thoroughly with soap and water after handling and before eating, drinking, chewing gum, using tobacco or using the toilet. Remove and wash contaminated clothing before reuse.

Personal Protective Equipment (PPE)

Applicants and other handlers must wear long-sleeved shirt and long pants, socks, shoes, and chemical-resistant gloves made of waterproof material such as, barrier laminate, butyl rubber, nitrile rubber, neoprene rubber, polyvinyl chloride or vinyl.

FIRST AID

If swallowed
• Call a poison control center or doctor immediately for treatment advice.
• Have person sip a glass of water if able to swallow.
• Do not induce vomiting unless told to do so by a poison control center or doctor.
• Do not give anything to an unconscious person.

If on skin
• Take off contaminated clothing.
• Rinse skin immediately with plenty of water for 15-20 minutes.
• Call a poison control center or doctor for treatment advice.

Have the product container or label with you when calling a poison control center or doctor, or going for treatment.

HOT LINE NUMBER

For 24-Hour Medical Emergency Assistance (Human or Animal) Call 1-800-356-4647
For Chemical Emergency, Spill, Leak, Fire or Accident, Call CHEMTREC 1-800-424-9300.
sprays. For application through sprinkler irrigation systems see application and calibration instructions below.

**TANK MIX COMPATIBILITY**

PRADIA is physically compatible in nozzles or screen blockage with many products recommended for control of diseases and insects on ornamentals. Read and follow all manufacturer’s label recommendations for the tank mix companion product. It is the applicator’s responsibility to ensure that the companion product is EPA approved for use on the intended ornamental crop. PRADIA is generally compatible with other insecticides, fungicides, adjuvants, fertilizers and micronutrient products provided sufficient free water is available for dispersion of all the tank mix products. The use of a high quality adjuvant at a rate of 0.05% to 0.1% on volume to volume basis may improve performance under extreme conditions. However, not all ornamental varieties have been tested with all possible tank mix combinations. Thus the combination should be tested for plant safety on a small portion of the ornamental crop to ensure that a phytotoxic response will not occur. In addition, the physical compatibility of PRADIA with tank mix partners must be evaluated before use. Conduct a jar test with intended tank-mix pesticides prior to preparation of large volumes. Use the following procedure: 1) Pour the recommended proportions of the products into a suitable container of water. Add the products to the tank-mixed in the following order: (a) wettable powders (b) dry flowable, (c) aqueous suspensions, (d) PRADIA (e) liquids, (f) solutions and emulsifiable liquid concentrates. 2) Mix thoroughly and 3) Allow to stand for 5 minutes. If the combination remains mixed or can be re-mixed readily, it is considered physically compatible. Any physical incompatibility in the jar test indicates that PRADIA should not be used in the tank-mix.

**INTEGRATED PEST MANAGEMENT**

PRADIA is an excellent insect pest control agent when used according to label directions for control of labeled insect pests. PRADIA is recommended for use as part of an Integrated Pest Management (IPM) program, which may include the use of pest-resistant crop varieties, cultural practices, crop rotation, biological control agents, pest scouting and pest forecasting systems aimed at preventing economic pest damage. Practices known to reduce insect pest development should be followed. Consult your state cooperative extension service or local agricultural authorities for additional IPM strategies established in your area. PRADIA may be used in State Agricultural Extension advisory (insect pest forecasting) programs that recommend application timing based upon environmental factors that favor insect pest development.

**RESISTANCE MANAGEMENT**

Some insect pests are known to develop resistance to products used repeatedly for insect control. CYCLANULIPROLE is an arthrnic diamide in IRAC Group 28 with the mode/target site of action being Rydanne receptor modulation. FLONICAROL is a Group 29 (selective feeding blocker) and controls target pests by contact and ingestion provoking rapid and irreversible feeding cessation. An insect pest management program that includes alternation or tank mixes between PRADIA and other labeled insecticides that have a different mode of action and/or control insect pests not controlled with PRADIA is essential to prevent insecticide-resistant insect pest populations from developing. PRADIA should not be utilized continuously nor tank mixed with insecticides that have shown to have developed insecticide resistance to the target insect pest.

Since insect pests differ in their potential to develop resistance to insecticides, follow the directions outlined in the “Directions For Use” section of the label for specific resistance management strategies. Consult with your Federal or State Cooperative Extension Service representatives for guidance on the proper use of PRADIA in programs that seek to minimize the occurrence of insect pest resistance.

Follow these instructions to postpone insecticide resistance unless directed otherwise in the specific directions for use sections of this label:

- Do not use the same mode of action (IRAC group number) on consecutive generations of insect pests.
- Do not apply PRADIA or other Group 28 and Group 29 insecticides more than 3 times per pest generation to the same insect species on an ornamental crop.
- Application to the next generation of insect pests must be with a product with a different mode of action (non-Group 28 or 29 insecticide).
- Do not use below the labeled rates of PRADIA alone or in tank mixes.
- Applications to the target pests should be made to the most susceptible insect life stages.
- Insecticide use should be based on an IPM program that includes scouting, record keeping, and considers cultural, biological and other chemical control practices.
- Monitor treated pest populations for resistance development.
- Contact your local extension specialist or certified crop advisors for any additional pesticide resistance-management and/or IPM recommendations for the specific site and pest problems in your area.

- More information on insect resistance is available online from the Insecticide Resistance Action Committee (IRAC) at http://www.irac-online.org.

For further information or to report suspected resistance contact ORP, Inc. at 1-800-356-4647.

**APPLICATION AND CALIBRATION TECHNIQUES FOR SPRINKLER IRRIGATION**

Plant injury or lack of effectiveness can result from the non-uniform distribution of treated water. If you have questions about calibration, you should contact State Extension Service specialists, equipment manufacturers or other experts.

DO NOT apply PRADIA through irrigation systems connected to a public water system. “Public water system” means a system for the provision to the public of piped water for human consumption if such system has at least 15 service connections or regularly serves an average of at least 25 individuals daily. The system must be operated in accordance with applicable laws.

Controls for both irrigation water and pesticide injection systems must be functionally interlocked, so as to automatically terminate pesticide injection when the irrigation water pump motor stops. A person knowledgeable of the irrigation system and responsible for its operation shall be present so as to discontinue pesticide injection and make necessary adjustments, should the need arise.

The irrigation water pipeline must be fitted with a functional, automatic, quick-closing check valve to prevent the flow of treated irrigation water back toward the water source. The pipeline must also be fitted with a vacuum relief valve and low-pressure drain, located between the irrigation water pump and the check valve, to prevent back-siphoning of treated irrigation water into the water source.

Always inject PRADIA into irrigation water after it discharges from the irrigation pump and after it passes through the check valve. Never inject pesticides into the intake line on the suction side of the pump.

Pesticide injection equipment must be fitted with a functional, normally closed, solenoid-operated valve located on the intake side of the injection pump. Interlock this valve to the power system, so as to prevent fluid from being withdrawn from the chemical supply tank when the irrigation system is either automatically or manually turned off.

The pesticide injection pipeline must contain a functional, automatic, quick-closing check valve to prevent the flow of fluid back toward the injection pump. The irrigation line or water pump must include a functional pressure switch that will stop the water pump motor...
when the water pressure decreases to the point where pesticide distribution is adversely affected. Spray mixture in the chemical supply tank must be agitated at all times, otherwise settling and uneven application may occur. DO NOT apply when wind speed favors drift beyond the area intended for treatment.

**SPRAY DRIFT MANAGEMENT**

The interaction of many equipment and weather-related factors determines the potential for spray drift. The applicator is responsible for considering all these factors when making application decisions.

**AVOIDING SPRAY DRIFT IS THE RESPONSIBILITY OF THE APPLICATOR.**

**IMPORTANCE OF DROPLET SIZE**

The most effective drift management strategy is to apply the largest droplets which are consistent with pest control objectives. The presence of sensitive species nearby, the environmental conditions, and pest pressure may affect how an applicator balances drift control and coverage. Applying larger droplets reduces drift potential, but will not prevent drift if applications are made improperly or under unfavorable environmental conditions. A droplet size classification system describes the range of droplet sizes produced by spray nozzles. The American Society of Agricultural and Biological Engineers (ASABE) provide a Standard that describes droplet size spectrum categories defined by a number of reference nozzles (fine, coarse, etc.). Droplet spectra resulting from the use of a specific nozzle may also be described in terms of volume mean diameter (VMD). Coarser droplet size spectra have larger VMD’s and lower drift potential.

**CONTROLLING DROPLET SIZE - GROUND APPLICATION**

**Nozzle Type** - Select a nozzle type that is designed for the intended application. With most nozzle types, narrower spray angles produce larger droplets. The use of low-drift nozzles will reduce drift potential.

**Pressure** - The lowest spray pressures recommended for the nozzle produce the largest droplets. Higher pressure reduces droplet size and does not improve canopy penetration. When higher flow rates are needed, using a higher-capacity nozzle instead of increasing nozzle pressure results in the coarsest droplet spectrum.

**Flow Rate/Orifice Size** - Using the highest flow rate nozzles (largest orifice) that are consistent with pest control objectives reduces the potential for spray drift. Nozzles with higher-rated flows produce coarser droplet spectra.

**BOOM LENGTH AND HEIGHT**

**Boom Height (ground)** - Applications made at the lowest height consistent with pest control objectives, and that allow the applicator to keep the boom level with the application site and minimize bounce, will reduce the exposure of spray droplets to evaporation and wind and reduce spray drift potential.

**WIND**

Drift potential increases at wind speeds of less than 3 mph (due to variable direction and inversion potential) or more than 10 mph. However, many factors, including droplet size and equipment type determine drift potential at any given wind speed. **AVOID APPLICATIONS DURING GUSTY OR WINDLESS CONDITIONS.** Do not make applications when wind speeds are greater than 15 mph.

**Note:** Local terrain can influence wind patterns. Every applicator must be familiar with local wind patterns and how they affect spray drift.

**TEMPERATURE AND HUMIDITY**

When making applications in hot and dry conditions, set up equipment to produce larger droplets to reduce effects of evaporation.

**SURFACE TEMPERATURE INVERSIONS**

Do not make applications into temperature inversions. Drift potential is high during a surface temperature inversion.

Surface inversions restrict vertical air mixing, which causes small-suspended droplets to remain close to the ground and move laterally in a concentrated cloud. Surface inversions are characterized by increasing temperature with altitude and are common on nights with limited cloud cover and light to no wind. They begin to form as the sun sets and often continue into the morning. Their presence can be indicated by ground fog; however, if fog is not present, inversions can also be identified by the movement of smoke from a ground source or an aircraft smoke generator. Smoke that layers and moves laterally in a concentrated cloud (under low wind conditions) indicates a surface inversion, while smoke that moves upward and rapidly dissipates indicates good vertical air mixing.

**SHELDDED SPRAYERS**

Shielding the boom or individual nozzles can reduce the effects of wind. However, it is the responsibility of the applicator to verify that the shields are preventing drift and not interfering with uniform deposition of the product.

**AIR ASSISTED (AIRBLAST) FIELD SPRAYERS**

Air-assisted field sprayers can carry droplets to the target via a downward directed air stream. Some may reduce the potential for drift, but if a sprayer is unsuitable for the application and/or set up improperly, high drift potential can result. It is the responsibility of the applicator to determine that a sprayer is suitable for the intended application, is configured properly, and that drift is not occurring.

**Note:** Air-assisted field sprayers can affect product performance by affecting spray coverage and canopy penetration. Consult the equipment application section of this label to determine if use of an air-assisted sprayer is recommended.

**SENSITIVE PLANT SPECIES:** Certain plants, such as some Pansy crops (V\(\text{iola}\) spp. hyb.) have been reported as sensitive to PRA\(\text{DA}\). Before any large-scale application, the user may test a small number of the type of plants to be treated at the required rates and under the desired growing conditions. Observe the treated plants for symptoms of phytotoxicity.

<tbody>
<tr>
<td><strong>Container and Field Grown (Bed) Plants</strong></td>
</tr>
<tr>
<td><strong>PRADIA</strong> can be applied to ornamentals, including conifers, grown in containers in greenhouses and outdoor nurseries. Apply <strong>PRADIA</strong> as a foliar spray in sufficient spray solution to thoroughly wet the foliage to the point of run-off, generally not to exceed 100 gallons per acre. If a larger volume is needed to wet the foliage, do not exceed the maximum rate of 17.5 fl. oz. per acre. Begin applications when pests first appear or when economic thresholds have been reached. <strong>Stink Bugs</strong> <strong>PRADIA</strong> provides suppression of stink bug <strong>NYMPHS</strong> ONLY. Use as a part of an Integrated Pest Management (IPM) program and target the most susceptible life stages and application timings. Use in conjunction with other modes of action and effective control products. Performance is enhanced when used with an effective adjuvant. For best results, use the high labeled rate when targeting stink bug nymphs. <strong>All Labeled Pests:</strong> For best results and maximum residual control, use the higher labeled rates unless otherwise directed. <strong>Resistance Management:</strong> Do not apply <strong>PRADIA</strong> or other Group 28 or Group 29 insecticides more than 3 times within a single generation of insect pests on an ornamental crop. <strong>Restrictions:</strong> Foliar application of this product on outdoor ornamental plants during bloom is prohibited from onset of flowering until flowering is complete; unless the rate is limited to 16 fl. oz./acre (0.053 lb. a.i./acre) and the application is made in the evening when bees are less likely to be actively foraging (2 hours prior to sunset to 8 hours prior to sunrise). This product has been determined to have a short residual toxicity (RT25) time, therefore the hazard to bees is significantly reduced soon after application. <strong>Minimal interval between treatment is 7 days.</strong></td>
</tr>
</tbody>
</table>

**Start applications when pests first appear or when economic thresholds have been reached.**

- **Stink Bugs** **PRADIA** provides suppression of stink bug **NYMPHS** ONLY. Use as a part of an Integrated Pest Management (IPM) program and target the most susceptible life stages and application timings. Use in conjunction with other modes of action and effective control products. Performance is enhanced when used with an effective adjuvant. For best results, use the high labeled rate when targeting stink bug nymphs.

### PRADIA Usage

- **Begin applications when pests first appear** or when economic thresholds have been reached. **All Labeled Pests:** For best results and maximum residual control, use the higher labeled rates unless otherwise directed.
