FIFRA Section 24(c) Special Local Need Label
FOR DISTRIBUTION AND USE ONLY WITHIN THE STATE OF OREGON

VAQUERO®
EPA Reg. No. 2935-559         EPA SLN No. OR-190014

For Application by Chemigation for Control of Grass Weeds in Cranberry

This label is valid until December 31, 2024 or until otherwise amended, withdrawn, canceled, or suspended.

Active Ingredient:
Clethodim ................................................................................................................................. 26.4%
Other Ingredients ......................................................................................................................... 73.6%
Total ............................................................................................................................................. 100%

KEEP OUT OF REACH OF CHILDREN
CAUTION

ENVIRONMENTAL HAZARDS
Do not apply directly to water, or to areas where surface water is present, or to intertidal areas below the mean high-water mark. Do not apply where runoff is likely to occur. Do not apply where weather conditions favor drift from areas treated. Do not contaminate water when disposing of equipment washwater or rinsate.

DIRECTIONS FOR USE
• It is a violation of Federal law to use this product in a manner inconsistent with its labeling.
• This Special Local Need (SLN) label and the federal label for this product must be in the possession of the user at the time of pesticide application.
• Follow all applicable directions, restrictions, Worker Protection Standard requirements, and precautions on the VAQUERO label, EPA Reg. No. 2935-559, and this SLN label.
• DO NOT apply this product in a way that will contact workers or other persons, either directly or through drift. Only protected handlers may be in the area during application. For any requirements specific to your state or tribe, consult the agency responsible for pesticide regulation.
• Apply VAQUERO, by chemigation, post-emergence to actively growing grasses according to the rate instructions on this SLN label.
APPLICATION BY CHEMIGATION FOR CONTROL OF GRASS WEEDS IN CRANBERRY

Apply VAQUERO in cranberries at a rate of 6.0 – 8.0 fluid ounces per acre. Add a nonionic surfactant (NIS) at a rate of 1–4 pints per acre.

Apply this product in 0.1 to 0.2 acre-inch of water either at the end of a regular irrigation set or as a separate application not associated with a regular irrigation set or as a separate application not associated with a regular irrigation, using the least amount of water that provides proper distribution and coverage. Application of more than labeled quantities of irrigation water per acre may result in decreased product performance by removing the chemical from the zone of effectiveness. Use a metering device to inject this product into the irrigation water at a constant flow. Constant agitation must be maintained in the chemical supply tank during the entire period of herbicide application. Inject the product with a positive displacement pump into the main line ahead of a right angle turn to ensure adequate mixing. Allow time for all lines to flush the herbicide through all nozzles before turning off irrigation water. To ensure the lines are flushed and free of remaining herbicide, a dye indicator may be injected into the lines to mark the end of the application period.

DO NOT apply VAQUERO through an irrigation system connected to a public water system. Public water system means a system for the provision to the public of piped water for human consumption if such system has at least 15 service connections or regularly serves an average of at least 25 individuals daily at least 60 days out of the year.

Special Use Instructions

• Apply this product only through solid set irrigation systems. Do not apply this product through any other type of irrigation system.
• Calibrate the irrigation and injection system before applying this product. Calibrate the injection pump with the irrigation system fully charged at the desired operating pressure. If you have questions about calibration, you should contact State Extension Service specialists, equipment manufacturers, or other experts.
• Check the irrigation system to ensure uniform application of water. The chemigation system, which is inclusive of the irrigation equipment and chemigation apparatus, must be properly maintained.
• The system must contain a functional check valve, vacuum relief valve, and low pressure drain appropriately located on the irrigation pipeline to prevent water source contamination from backflow.
• The pesticide injection pipeline must contain a functional, automatic, quick-closing check valve to prevent the flow of fluid back toward the injection pump.
• The pesticide injection pipeline must also contain a functional, normally closed solenoid-operated valve located on the intake side of the injection pump and connected to the system interlock to prevent fluid from being withdrawn from the supply tank when the irrigation system is either automatically or manually shut down.
• The system must contain functional interlocking controls to automatically shut off the pesticide injection pump when the water pump motor stops.
• The irrigation line or water pump must include a functional pressure switch which will stop the water pump motor when the water pressure decreases to the point where pesticide distribution is adversely affected.
• Systems must use a metering pump, such as a positive displacement injection pump (e.g. diaphragm pump) effectively designed and constructed of materials that are compatible with pesticides and capable of being fitted with a system interlock.
• A person knowledgeable of the chemigation system and responsible for its operation or under the supervision of the responsible person, shall shut the system down and make necessary adjustments should the need arise.
• DO NOT apply when wind speed favors drift beyond the area intended for treatment.
• Crop Injury, lack of effectiveness, or illegal pesticide residues in the crop can result from non-uniform distribution of treated water.

**Restrictions and Precautions**

• DO NOT enter or allow worker entry into treated areas during the restricted entry interval (REI) of 24 hours.
• DO NOT apply between the “hook” stage and full fruit set.
• DO NOT apply more than 8.0 fluid ounces per acre of VAQUERO in a single application.
• DO NOT apply more than 32.0 fluid ounces of VAQUERO (0.5 lb. a.i.) per acre per season.
• For repeat applications, allow a minimum 14-day interval between applications.
• DO NOT apply within 30 days of harvest (30-day PHI).
