overnight minutes. A solution of 100 ppm available chlorine may be used in the sanitizing solution if a chlorine test kit is with 10 gallons of water, to provide approximately 200 ppm available chlorine by weight. Clean equipment surfaces in the normal manner. Prior to use, remove any excess solution. If solution contains less than 50 ppm available chlorine, as determined by a suitable test kit, either discard the solution or add sufficient product to reestablish a 200 ppm residual. Do not rinse equipment with water after treatment.

Sanitizers used in automated systems may be used for general cleaning but may not be reused for sanitizing purposes.

SOLUTIONS CONTAINING AN INITIAL CONCENTRATION OF 100PPM AVAILABLE CHLORINE MUST BE TESTED AND ADJUSTED PERIODICALLY TO INSURE THAT THE AVAILABLE CHLORINE DOES NOT DROP BELOW 50PPM.

If solution contains less than 50 ppm available chlorine, as determined by a suitable test kit, either discard the solution or add sufficient product to reestablish a 200 ppm residual. Do not rinse equipment with water after treatment.

If no test kit is available, prepare a sanitizing solution by thoroughly mixing 15 oz. of this product with 10 gallons of water, to provide approximately 600 ppm available chlorine by weight. Clean equipment surfaces in the normal manner. Prior to use, remove all surfaces thoroughly with the sanitizing solution, maintaining contact with the sanitizer for at least 2 minutes. Rinse equipment with water after treatment and do not soak equipment overnight.

SUGGESTION OF POROUS FOOD CONTACT SURFACES:

- SUCH AS CUTTING BLOCKS, WOOD-TOP TABLES, STEAM TABLE BOARDS AND OTHER POROUS SURFACES;

- STRONG OXIDIZING AGENT:

- Chlorine solution. The sanitizer temperature should not exceed 130ºF (54ºC). Spray the warm sanitizer so that the eggs are thoroughly wetted. Allow the eggs to thoroughly dry before casing or breaking.
