SLUGS AND SNAILS: Apply 59 fl. oz. per treated acre in sufficient water for thorough coverage OR 5 to 10 oz. in ten gallons of water per 200 sq. ft. Apply a maximum of 6 applications per season with at least 14 days between applications.

CITRUS: Apply 3.5 oz. per treated tree in sufficient water per tree for thorough coverage. Apply a maximum of 3 applications per season with at least 14 days between applications.

FOOD CROPS: Apply 5 oz. per treated row 12-24 hours before or after irrigation or watering. For greens, apply directly to the soil surface. Do not apply to plant parts. Do not apply in such a manner as to cause drift of product onto plants. For best results, apply in the evening.

Thoroughly water areas to be treated before application. Apply only to soil surface around plants and in rows between plants. Use equipment that applies directly to the soil surface. Do not apply through an irrigation system. The pesticide injection pipeline must contain a functional, automatic, quick-closing check valve to prevent the flow of water from the supply tank when the irrigation system is either automatically or manually shut down. The irrigation system must contain a functional check-valve, vacuum relief valve, and low pressure drain appropriately located on the irrigation pipeline to prevent water-source contamination from backflow.
The document contains instructions for the safe use and handling of a hazardous substance, including precautions, first aid measures, and disposal procedures. It also provides information on environmental hazards and regulations for agricultural and non-agricultural use. The text is a mix of chemical safety and agricultural application guidelines, emphasizing the importance of proper handling and disposal to prevent harm to humans, animals, and the environment.
