**GENERAL INSTRUCTIONS**

Notify workers of the applications by warning them orally and by posting warning signs at entrances to treated areas.

**ENVIRONMENTAL HAZARDS**

In all states EXCEPT Minnesota, North Dakota, and Michigan, the maximum amount of product that can be applied is 10 ounces per acre day intervals.

Early Blight, Late Blight, Suppression of Colorado Potato Beetle.

**RESTRICTED USE PESTICIDE**

The use of this product is restricted to agricultural workers, handlers, and applicators.

**POISON**

Do not open to oral ingestion. Do not apply to soil or in a manner from which it can enter water bodies. Do not apply to crops that may be used to feed livestock. Do not allow livestock to enter treated areas for at least 7 days. Do not apply to crops that may enter fresh or saltwater ecosystems. Do not apply on days of irrigation or when water is being applied. Do not apply to treated surfaces if the water will be used for irrigation, billboards, or other disease infections. Do not apply when weather conditions do not favor dry weather conditions. Do not apply to areas that are underlain with or approached by water bodies.

**APPLICATIONS**

Aerial applications require a low volume of water. The number of applications and amount of water should be adjusted to maintain effective control. Crop injury, lack of effectiveness or illegal pesticide residues in the crop can result from non-uniform distribution of treated water.

**CHEMIGATION**

AGRI TIN should be chemigated. The chemigation nozzle should be directly behind the spray boom. The nozzle should be directed parallel to the crop. Chemigation is recommended. Diluted spray should be directed uniformly to all parts of the plant and the gallonage increased as needed to maintain control. Use the lower rate for the first two applications or until the disease becomes severe or during dry periods.

**AERIAL SPRAY DRIFT MANAGEMENT**

Volume - Use high flow rate nozzles to apply the highest practical spray volume. Nozzles with higher rated flows produce larger droplets to evaporation and wind.

BOOM LENGTH: For some use patterns, reducing the effective boom length to less than 3/4 of the wingspan or rotor length may be needed to maintain control. Use the lower rate for the first two applications or until the disease becomes severe or during dry periods.

**PERSONAL PROTECTIVE EQUIPMENT**

Chemical resistant headgear if overhead exposure.

Chemical resistant apron.

Chemical resistant footwear plus socks.

Goggles or face shield.

Protective eyewear, chemical-resistant apron for mixing and loading or equipment maintenance, chemical-resistant headgear for general use.

**PRECAUTIONS:**

Do not apply when weather conditions do not favor dry weather conditions. Do not apply to treated surfaces if the water will be used for irrigation, billboards, or other disease infections. Do not apply to crops that may enter fresh or saltwater ecosystems. Do not apply to treated surfaces if the water will be used for irrigation, billboards, or other disease infections. Do not apply to treated surfaces if the water will be used for irrigation, billboards, or other disease infections. Do not apply to treated surfaces if the water will be used for irrigation, billboards, or other disease infections. Do not apply to treated surfaces if the water will be used for irrigation, billboards, or other disease infections. Do not apply to treated surfaces if the water will be used for irrigation, billboards, or other disease infections. Do not apply to treated surfaces if the water will be used for irrigation, billboards, or other disease infections.
