Silver Scurf (Helminthosporium solani) Control on Potatoes During Storage
High initial dose of 130 to 160 ppm may be required to kill Silver Scurf apores for control of secondary spread in storage. Rates will depend on level of infection, storage temperature, storage duration, and condition of the potato skin, etc. Applications for Silver Scurf control should be made after the potatoes has been and has been the filted and has the process has begun. Subsequent applications may be required if the potatoes are disturbed.

DIRECTIONS FOR USE
BIOX-C can be applied anytime after potatoes are placed into storage. BIOX-C is intended for application as an aerosol through Forced Air Distribution Systems. Forced Air Distribution Method
1. Prepare aerosol generating equipment. Insert aerosol generator intake hose into the BIOX-C container.
2. Set air as instructed.
3. Place the exhaust end of aerosol generator at the center of the plenum (air mixing chamber) pointing in the direction of the air flow as an example of an application set-up. Methods of BIOX-C application vary to the storage design, ventilation system, etc. Uniform BIOX-C applications are usually accomplished by experienced, licensed applicators. Contact your local applicator for additional information.
4. Operate recirculation fan continuously during application and for at least 4 hours after completing application (or until fog has completely settled). For flowers, do not allow the BIOX-C to dry on the flowers prior to removal of potatoes from storage to reduce potential potato surface odor carry-over is suggested. Length of ventilation time depends on the rate of air passage and storage temperature.

Potato Sprout Control During Storage
Initial and subsequent aerosol application doses of BIOX-C vary to potato variety, bud growth stage of the potatoes, storage temperature, duration of storage, pile conditions (rot, dirt, etc) and storage design. Contact your local BIOX-C dealer to determine the required application rate recommendations in the table below.
