Why This Product is So Effective:

1. This product is highly attractive to many ant species. Ants are naturally attracted to sweet-tasting foods such as syrup, honey, or baked goods. Amdro Ant Block Home Perimeter Ant Bait is formulated to attract ants with a bait that is highly palatable.

2. The active ingredient, hydramethylnon, is designed to be attractive to various ant species. Hydramethylnon is an ant-killing ingredient that is effective against a wide range of ant species, including common household ants.

3. Amdro Ant Block Home Perimeter Ant Bait is formulated with a delayed-action mechanism that allows foraging ants to bring the bait back to the nest. This makes it easier for the entire colony, including the queen(s), to be targeted and eliminated.

4. When ants consume the bait, they take it back to their nests. This makes it easy for the bait to reach the queen, which is usually the most difficult ant to kill. The bait is absorbed by the queen and passed on to her daughters, ensuring that the entire colony is killed.

5. The product is effective against a wide range of ant species, including the following:
   - Acrobat ants
   - Allegheny mound ants
   - Argentine ants
   - Bigheaded ants
   - Black turf ants
   - Carpenter ants
   - Crazy ants
   - Fire ants (imported and native)
   - Ghost ants
   - Harvester ants
   - Honey ants
   - Lawn ants
   - Little black ants
   - Pavement ants
   - Pharaoh ants
   - Pyramid ants
   - Southern ants
   - Thief ants
   - White-footed ants

6. The bait works by causing behavioral changes and physical damage in the ants. When ants consume the bait, they become unable to forage and eventually die.

TRICKS:

- Pour one or two ounces of bait in a shallow dish in the area(s) of greatest infestation. Use a sprinkling pattern to lightly cover the area.
- Use any type of bait container if it will not disturb the ants.
- Keep the bait off of driveways, sidewalks, and other non-ant-inhabited areas to prevent ants from robbing the bait.
- Place the bait in areas where ants are commonly found, such as under porches, around trash bins, and along the edges of buildings.
- Do not apply bait to wet ground or grass or if rain is expected within 24 hours. Prolonged exposure to air may turn oil rancid and reduce the bait's effectiveness.
- Do not apply bait where it will contact any aquatic life, livestock, or domestic animals.
- Do not contaminate food or water sources with the bait.

Note: Use care to not disturb the mound when treatments are applied. For Fire Ants, sprinkle the bait around the mound, taking care to not disturb the mound. For Allegheny Mound Ants, sprinkle the bait around the mound, taking care to not disturb the mound. For Argentine Ants, sprinkle the bait around the mound, taking care to not disturb the mound. For Bigheaded Ants, sprinkle the bait around the mound, taking care to not disturb the mound.
