MasterLine®

I MaxxPro®
Insecticide in Water Soluble Packets

03947908
04032032F 110322AV1a

For use by individuals/ firms licensed or registered by the state to apply termicide products. States may have more restrictive requirements regarding qualifications of persons using this product. Consult the structural pest control regulatory agency of your state prior to use of this product.

For prevention or control of subterranean termites, drywood termites, dampwood termites, carpenter ants, and other wood-inesting insects.

ACTIVE INGREDIENT:
Imidacloprid: (5-Chloro-3-pyridinylmethyl) N-nitro-2-imidazolidinimine

INERT INGREDIENTS

Do Not Remove Packets From Container Except For Immediate Use.
Keep water soluble packets in this container and store in a cool dry place but not below freezing (32°F).

EPA Reg. No. 432-1352-73748
EPA Est. No. 00907-NJ-1

Stop - Read the label before use.
Keep out of reach of children.

CAUTION

PARA EL USUARIO: Si usted no lee o entiende inglés, no use este producto hasta que le hayan explicado completamente las instrucciones que figuran en el etiqueta.

(TO THE USER: If you cannot read or understand English, do not use this product until the label has been fully explained to you.)

For MEDICAL and TRANSPORTATION Emergencies ONLY Call 24 Hours A Day 1-800-334-7577
For PRODUCT USE Information Call 1-800-331-2887

FIRST AID

If Swallowed:
• Call a poison control center or doctor immediately for treatment advice.
• Have person sip a glass of water if able to swallow.
• Do not induce vomiting unless told to do so by a poison control center or doctor.
• Do not give anything by mouth to an unconscious person.

If on Skin or Clothing:
• Take off contaminated clothing.
• Wash skin immediately with plenty of soap and water for 15 to 20 minutes.
• Call a poison control center or doctor for treatment advice.

If in Eyes:
• Hold eyelids open and rinse slowly and gently with water for 15 to 20 minutes.
• Remove contact lenses, if present, after the first 5 minutes, then continue rinsing eye.
• Call a poison control center or doctor for treatment advice.

NOTE TO PHYSICIAN: No specific antidote is available. Treat patient symptomatically.
PRECAUTIONARY STATEMENTS

HAZARDS TO HUMANS AND DOMESTIC ANIMALS

CAUTION

 Harmful if swallowed, inhaled, or absorbed through skin. Causes eye irritation. Avoid contact with skin, eyes, or clothing. Avoid breathing dust or vapor. Wash thoroughly with soap and water after handling.

Remove contaminated clothing and wash before reuse. Keep children or pets away from treated area until dry.

When working adjacent to an existing structure, the applicator must check the area to be treated, and immediately adjacent areas of the structure, for visible and accessible cracks and holes to prevent any solids or significant quantities to persons occupying the structure. People present or residing in the structure during application must be advised to remove their pets and themselves from the structure if they see any signs of leakage. After application, the applicator is required to check for leaks. All leaks resulting in the deposition of termicide in locations other than those prescribed on this label must be cleaned up prior to leaving the application site. Do not allow people or pets to contact contaminated areas or to recontaminate contamined areas of the structure until the clean-up is completed.

Personal Protective Equipment

Pesticide handlers (farmers, operators, and applicators) must wear long-sleeved shirt and long pants, socks, shoes, and water-proof gloves. After the product is diluted in accordance with label directions for use, shirt, sleeves, socks, shoes and water-proof gloves are sufficient. In addition, all pesticide handlers must wear protective eyewear when working in a non-ventilated space or when applying termicide by puddling or sub-slab injection.

ENVIRONMENTAL HAZARDS

This product is highly toxic to aquatic invertebrates. Do not apply directly to water, to areas where surface water is present, or to intertidal areas below the mean high water mark. Do not contaminate water when disposing of equipment washwater. Apply this product only as specified on this label. Extreme care must be taken to avoid runoff. Apply only to soil or other NMS substrate that will accept the solution at the specified rate. Do not treat soil that is water-saturated or frozen, or in any conditions where run-off or movement from the treatment area is likely to occur.

DIRECTIONS FOR USE

It is a violation of Federal Law to use this product in a manner inconsistent with its labeling.

Structures that contain wells or other structures within the foundation of the structure can only be treated using the treated backfill method described in this treatment around wells and exterior sections of this label. Consult state and local specifications for specified distances or wells from treated areas, or if such regulations do not exist, refer to Federal Housing Administration Specifications (F.H.A.) for guidance.

MIXING TABLE FOR MAXPRO® INSECTICIDE IN WATER SOLUBLE PACKETS

<table>
<thead>
<tr>
<th>GALLONS OF FINISHED SOLUTION DESIRED</th>
<th>NUMBER OF 0.05% CONCENTRATE IN WATER SOLUBLE PACKETS NEEDED</th>
<th>NUMBER OF 0.1% CONCENTRATE IN WATER SOLUBLE PACKETS NEEDED</th>
</tr>
</thead>

<td>8</td>
</tr>
</tbody>
</table>

MIXING: Refer to Mixing Table for proper amount of MaxPro Insecticide in Water Soluble Packets to be used.

With each fill envelope and liner packets containing MaxPro Insecticide in Water Soluble Packets, the clear inner packet is water soluble. Do not put the clear inner packets with wet hands or gloves. Rough handling may cause breakage. Reseal fill envelope to protect remaining packets.

To prepare the spray mixture, open the fill envelope and drop the required number of unopened clear water soluble packets into the sprayer tank while filling with water to the desired level. Operate the sprayer while mixing. Depending on the water temperature and the degree of agitation, the packets should be completely dissolved within a few minutes from the time they are added into the water. Carry water temperature increases the time needed for the inner packet to dissolve completely.

Do not use MaxPro Insecticide in Water Soluble Packets with products or in a tank that may contain boron or release free chlorine. The resultant reaction of PVA and boron or free chlorine is a plastic which is not soluble in water or solvents such as diesel oil, kerosene, gasoline or alcohol. Use of deionized water is acceptable.

APPLICATION VOLUME

The application volume specified in the MaxPro Insecticide in Water Soluble Packets DIRECTIONS FOR USE* are to be used whenever possible. However, where soil conditions will not accept application of 4 gallons of MaxPro Insecticide in Water Soluble Packets per 10 linear feet, increase the MaxPro Insecticide in Water Soluble Packets concentration may be applied in 2 gallons of solution per 10 linear feet. For example, if 0.025% is the correct use rate to be applied in 4 gallons of water, then 2 gallons of 0.1% dilution may be used for 10 linear feet to deliver an equivalent amount of MaxPro Insecticide in Water Soluble Packets per unit of soil.

CONTROL

Treatment standards for subterranean termite control may vary due to regulations, treatment procedures, soil types, construction practices and other factors. The purposes of chemical soil treatment for termite control is to establish a continuous chemical treated zone (horizontal and/or vertical) between the wood and other cellulose material in the structure and the termite colonies in the soil. Follow all federal, state, and local regulations and treatment standards for protection of a structure from termites. In some instances where an aerial or above ground colony is established, supplemental treatments to control the termite colonies, landscape modifications, and/or structural repairs may be needed to depopulate termite of a mustang source. Use a 0.0% to 0.1% dilution based on local recommendations. Generally a 0.05% dilution is used for typical control situations. Where severe or persistent infestations occur, a 0.1% dilution may be used.

PRE-CONSTRUCTION TREATMENT

Do not apply at a lower dosage and/or concentration than specified on this label for application prior to installation of the finished grade.

Prior to each application, applicators must notify the general contractor, construction superintendent, or similar responsible party, of the intended
termiticide application and intended sites of application and instruct the responsible person to notify construction workers and other individuals to leave the area to be treated during application and until the termiticide is absorbed into the soil.

**CONCRETE SLAB-ON-GROUND OR BASEMENTS:** Apply an overall treatment to the entire surface of soil or other substrate to be covered by the slab including areas to be under carports, porches, basement floor and entrance platforms. Apply at the rate of 1 gallon of solution to accurately and uniformly cover 10 square feet. If soil under slab is gravel or other coarse aggregate, apply at the rate of 1.5 gallons of solution to accurately and uniformly cover 10 square feet. In addition, apply 4 gallons of solution (see APPLICATION VOLUME) per 10 linear feet to provide a uniform treated zone to soil at critical areas such as along the inside of foundation walls, and around plumbing, bath tubs, utility services, and other features that will penetrate the slab.

After completion of grading, make an application by trenching or trenching and sodding around the slab or foundation perimeter. Rooling may be done by applying the soil to the bottom of a shallow trench. When rooling, not holes must be spaced in a manner that will allow for a continuous chemical treated zone, not to exceed 12 inches, to be deposited along the treated area. Rod holes must not extend below the footing. Apply 4 gallons of solution (see APPLICATION VOLUME) per 10 linear feet, per foot of depth to provide a uniform treated zone. When rooling, the trench along the outside foundation should be about 6 inches wide and 6 inches deep. Use a low pressure spray end to exceed 25 psi at the treatment tool when the water is going to treat soil which will be placed in the trench after rooling. Mix the spray solution with soil as it is being placed in the trench. When treating walls in hollow masonry walls, use 2 gallons of solution per 10 linear feet of wall. Apply solution so it will exit the footing by injecting into the lower areas of the wall, just above the floor or footing.

When rooling foundations deeper than 4 feet, apply the termiticide as the backfill is being replaced, or if the construction contractor fails to notify the applicator to permit this, treat the foundation to a minimum depth of 4 feet after the backfill has been installed. The applicator must treat and not into the trench or trench along the foundation walls and around pillars and other foundation elements, at the rate prescribed from grade to a minimum depth of 4 feet. When the top of the footing is exposed, the applicator must treat the soil adjacent to the footing to a depth not to exceed the bottom of the footing. However, in no case treat a structure below the footing.

Rooling in trench followed by rooling of trench and treatment of backfill may provide a better opportunity to achieve a continuous chemical treated zone than using soil roolding stone to establish a vertical termiticide treated zone.

**CRAWL SPACES:** Application must be made by trenching or trenching and rooling downward along the inside and outside of foundation walls, around pillars, interior support in contact with the soil, plumbing, and utility services. Apply 4 gallons of solution [see APPLICATION VOLUME] per 10 linear feet, per foot of depth to provide a uniform treated zone. Rodding may be done from the bottom of a shallow trench to the top of the footing or a minimum of 4 feet. When rooling, not holes must be spaced in a manner that will allow for a continuous chemical treated zone to be deposited along the treated area. Rod holes must not extend below the footing. When trenching, the trench shall be about 6 inches wide and 6 inches deep. Use a low pressure spray end to exceed 25 psi at the treatment tool when the water is going to treat soil which will be placed in the trench, mixing the spray solution with soil as it is being placed in the trench.

**HOLLOW BLOCK FOUNDATIONS OR Voids:** Hollow block foundations or voids in masonry resting on the footing may be treated to provide a continuous chemical treated zone in the voids at the footing. Apply 2 gallons of solution per 10 linear feet to the lower part of the void so that it reaches the top of the footing or slab.

Treatment of voids in block or masonry foundations must be closely examined. Applicators must inspect areas of possible runoff as a precaution against application leakage in the treated areas. Some areas may not be treatable or may require mechanical alteration prior to treatment.

All labels are subject to the regulation of other agencies. Other than the prescribed on this label must be cleared up prior to leaving the applications refer to Precautionary Statements.

**RESTRICTION:** Do not allow people or pets to contact or to recover the contaminated areas of the structure until the clean up is completed.

**POST-CONSTRUCTION TREATMENT**

**CONCRETE SLAB-ON-GROUND:** To apply a treatment under the slab, including attached carports, porches, entrance platforms, garages and similar rigid structures, it may be necessary to drill through the slab or exterior foundation. Drill holes should be spaced in a manner that will allow for a continuous chemical treated zone. Treat all existing cracks and cost, exterior or exterior sides. Also treat around bath tubs, plumbing, and utility services which penetrate the slab. Apply 4 gallons of solution (see APPLICATION VOLUME) per 10 linear feet, per foot of depth to provide a uniform treated zone. DO NOT MAKE TREATMENT (UNLESS LOCATION OF HOT OR AIR CONDITIONING DUCTS AND VENTS ARE KNOWN AND MARKED ON THE CONSTRUCTION PLANS) DUCTS AND VENTS ARE KNOWN AND MARKED ON THE CONSTRUCTION PLANS (see APPLICATION VOLUME) per 10 linear feet, per foot of depth to provide a uniform treated zone. Do an inspector or inspector's inspector if inspection is used.

**BASMENTS - OUTSIDE PERIMETER:** Apply the outside of the exterior walls, as application must be made by trenching or rooling within the walls. Roolding depth should be to the top of the footing, or to a minimum of 4 feet to avoid sticking or local regulations. When rooling through a trench, do a least 6 inches wide and 6 inches deep. Apply 4 gallons of solution (see APPLICATION VOLUME) per 10 linear feet, per foot of depth to provide a uniform treated zone by rooling through the trench. Use a low pressure spray to treat soil which will be placed into the trench after rooling. Mix spray solution with soil as it is being placed in the trench.
BASEMENTS - INSIDE PERIMETER: If necessary, treat by drilling along the perimeter of the interior walls. Applications also may be necessary around sump pump, floor drains, sump pots, expansion joints, or other cracks or holes in the basement floor. Apply 4 gallons of solution (see APPLICATION VOLUME) to the soil at the top of the footing. For each 10 linear feet of perimeter, apply 2 gallons of solution to the soil at the top of the footing. Apply 2 gallons of solution for every linear foot of perimeter below the footing line. Use a rough, textured surface to enhance penetration. Applications must be made in a manner that allows for application of a continuous chemical treated zone. Use a grid of at least 10 linear feet between each application. All areas must be covered with a non-turbulent material. Pools of water in the treated zone must be thoroughly mixed with soil to ensure uniform coverage. A thorough inspection of the treated area is required to ensure that all areas have been treated. Non-turbulent areas must be covered with a non-turbulent material.

MIXING BLOCK FOUNDATION OR WOODS (if necessary): Mixing block foundations or woods in the treated zone shall be treated with a chemical treated zone as described above. Apply 2 gallons of solution to the soil at the top of the footing. Apply 2 gallons of solution per linear foot of the footing to the soil at the top of the footing. Use a rough, textured surface to enhance penetration. Applications must be made in a manner that allows for application of a continuous chemical treated zone. Use a grid of at least 10 linear feet between each application. All areas must be covered with a non-turbulent material. Pools of water in the treated zone must be thoroughly mixed with soil to ensure uniform coverage. A thorough inspection of the treated area is required to ensure that all areas have been treated. Non-turbulent areas must be covered with a non-turbulent material.

TREATMENT OF WOODS OR RUBBLE FOUNDATION WOODS: Treatment of woods or rubble foundation woods shall be applied as needed. Applications must be made in a manner that allows for application of a continuous chemical treated zone. Use a grid of at least 10 linear feet between each application. All areas must be covered with a non-turbulent material. Pools of water in the treated zone must be thoroughly mixed with soil to ensure uniform coverage. A thorough inspection of the treated area is required to ensure that all areas have been treated. Non-turbulent areas must be covered with a non-turbulent material.

TREATMENT OF TERRACES: If necessary, treat terraces with a chemical treated zone as described above. Apply 2 gallons of solution per linear foot of the terrace. Use a rough, textured surface to enhance penetration. Applications must be made in a manner that allows for application of a continuous chemical treated zone. Use a grid of at least 10 linear feet between each application. All areas must be covered with a non-turbulent material. Pools of water in the treated zone must be thoroughly mixed with soil to ensure uniform coverage. A thorough inspection of the treated area is required to ensure that all areas have been treated. Non-turbulent areas must be covered with a non-turbulent material.

TREATMENT OF TERRACES: If necessary, treat terraces with a chemical treated zone as described above. Apply 2 gallons of solution per linear foot of the terrace. Use a rough, textured surface to enhance penetration. Applications must be made in a manner that allows for application of a continuous chemical treated zone. Use a grid of at least 10 linear feet between each application. All areas must be covered with a non-turbulent material. Pools of water in the treated zone must be thoroughly mixed with soil to ensure uniform coverage. A thorough inspection of the treated area is required to ensure that all areas have been treated. Non-turbulent areas must be covered with a non-turbulent material.

EXTerior Perimeter/Interior Spot Treatment

Extremely Perimeter/Interior Spot Treatment is an optional method of termite treatment only for use in post-construction applications, after the final grade is established. Structural protection when using the Exterior Perimeter/Interior Spot Treatment is accomplished by: 1) establishing a continuous treated zone around the entire exterior foundation wall of the building; and 2) spot-treating infested areas on the building interior. Soil adjacent to the exterior foundation wall must be treated in the same manner as commercial (off) applications. It is required that a complete and continuous treated zone be established by the contractor. This shall be a thorough inspection of the treated area is required to ensure that all areas have been treated. Non-turbulent areas must be covered with a non-turbulent material. Pools of water in the treated area must be thoroughly mixed with soil to ensure uniform coverage. A thorough inspection of the treated area is required to ensure that all areas have been treated. Non-turbulent areas must be covered with a non-turbulent material.
EXTERIOR PERIMETER TREATMENT

It is required that all structures, regardless of the type of construction, be protected by establishing a vertical fumigant zone along the outer perimeter of the foundation wall. Consult the OUTER FOUNDATION WALLS section of this label (see below) for detailed directions on this treatment procedure.

1. OUTER FOUNDATION WALLS: Application must be made by trenching, or where appropriate (see below) by fumigating, or trenching and fumigating and rotting from the bottom of the trench, around the entire perimeter of the foundation walls. When trenching, excavate a trench along the outside foundation that is about 6 inches wide and 6 inches deep. Apply 4 gallons of solution (see APPLICATION VOLUME) per 10 linear feet, per foot of depth to provide a uniform vertical fumigant zone.

   • For shallow foundations, one foot or less of depth, dig a narrow trench that does not exceed 6 inches wide and 6 inches deep along the outside of the foundation walls, being careful not to dig below the bottom of the footings. For foundations with exposed footings, dig a trench along the outside taking care not to undermine the footing.

   • For basements and other foundations deeper than one foot, the application must be made by trenching and rotting from the bottom of a shallow trench. When rodding, rod holes must be spaced in a manner that will allow for a continuous treated zone, not exceed 12 inches, to be deposited along the treated area. Rod holes must not extend below the footing. Rodding depth must be by the top of the footing, or to a maximum depth of 4 feet, or according to state or local regulations.

   • For all applications, apply the solution into the trench and mix with the excavated soil as it is repacked into the trench. Use a low-pressure spray to treat soil that will be replaced into the trench after rodding. Mix spray solution with the soil as it is being repacked in the trench.

   Where direct access to soil on the outer foundation wall is impossible due to attached porches, entrance platforms, garages and similar slab structures, consult the CONCRETE SLAB-ON-GROUND section of this label for directions on treatment of soil beneath these structures. However, where obstructions (i.e., concrete walkways) adjacent but not directly attached to foundation, or where soil type and/or conditions prevent trenching the exterior perimeter treatment may be performed at the obstructed location by rodding alone. When rodding, rod holes must be spaced in a manner that will allow for a continuous treated zone, not exceed 12 inches, to be deposited along the treated area.

2. CONCRETE SLAB-ON-GROUND: To treat slabs and foundations, include attached patios, porches, entrance platforms, garages and similar slabs structures abutting the foundation walls, it is necessary to drill through the slab. If an indentation is associated with an expansion joint, crack, utility penetration, or similar access point in the slab, treat by cutting and injecting through the slab. Rod holes must be spaced in a manner that will allow for application of a continuous chemical treated zone, but must extend a minimum of 3 feet on both sides of the treated site. Apply 4 gallons of solution (see APPLICATION VOLUME) per 10 linear feet.

3. INACCESSIBLE CRAWL SPACES: If termite activity is found along the perimeter wall or on a pier within an inaccessible crawl space, areas with termite activity must be treated. Apply 4 gallons of solution (see APPLICATION VOLUME) per 10 linear feet to create a vertical treated zone, which must extend a minimum of 3 feet on both sides of the infested site. Optional directions for horizontal rodding: Treatment may also be made by drilling through the foundation wall or through the floor above to treat the soil along the perimeter wall at a rate of 4 gallons of solution (see APPLICATION VOLUME) per 10 linear feet. Prior to drilling, be aware that not to exceed 16 inches. Many states have shorter intervals on check state regulations which may apply.

   If termite activity is neither along the perimeter wall nor on a pier within the inaccessible crawl space, to prevent subterranean termites from communicative activity between soil in the crawl space and wooden elements in the structure, an overall soil treatment of this product may be applied. Remove all cellulose debris before application. Apply 1 gallon of solution (see APPLICATION VOLUME) per 10 square feet to provide a uniform chemical treated area.

4. ACCESSIBLE CRAWL SPACES: If termite activity is found within an accessible crawl space, the area(s) where termite activity exist must be treated by fumigating, or by trenching and rodding from the bottom of the trench, along the interior foundation walls, around piers, interior supports in contact with the soil, plumbing, or utility penetrations. Apply 4 gallons of solution (see APPLICATION VOLUME) per 10 linear feet, per foot of depth. To create a vertical treated zone, which must extend a minimum of 3 feet on both sides of the infested site. Rodding may be done from the bottom of a shallow trench to the top of the footing for 2 to a maximum depth of 4 feet. When rodding, rod holes must be spaced in a manner that will allow for a continuous treated zone, not to exceed 12 inches, to be deposited along the treated area. Rod holes must not extend below the footing. When trenching, dig a narrow trench about 6 inches wide and 6 inches deep. Use a low-pressure spray to treat soil which will be placed in the trench, mixing the spray solution with soil as it is being placed in the trench.

RESTRICTIONS:

Do not allow people or pets to contact or to reoccupy the contaminated areas of the structure until the clean up is completed.

INTERIOR SPOT TREATMENT

Targeted applications must be made to all known infested sites inside the structure. One or more of the following application methods must be used to make interior spot treatments:

• Sub-slab injections inside the slab at or near areas where termites are known to be penetrating the slab to reach wood in the structure and/or at or near sites of active infestations. Apply 4 gallons per 10 linear feet per foot of depth. Sub-slab injections must extend to a minimum of 3 feet on both sides of every known infested site at expansion joints or cracks in the slab.

• Void treatments using injection techniques and/or surface applications, to treat active infestations in structural timbers. To maximize dispersion of treatment solution in soil and in above ground locations, the use of foam and directional dispersal tips is encouraged for all interior spot treatments. Consult sections of this label appropriate to the element of construction, FOAM APPLICATIONS OR CONTROL, OR WOOD INVESTING PESTS for detailed directions on any of these treatment procedures.

1. INTERIOR SLABS: When termite activity is located within an interior wall or structural member, the soil beneath the slab and the wall void at this site of activity must be treated. The source of infestation at the expansion joint, crack, through a utility penetration, or similar access point in the slab, must be treated by drilling and injecting through the slab. Stilt totes in the slab must be spaced in a manner that will allow for application of a continuous chemical treated zone, which must extend a minimum of 3 feet on both sides of the infested site. Apply 4 gallons of solution (see APPLICATION VOLUME) per 10 linear feet. To maximize dispersion of treatment solution in soil, the use of foam and directional dispersal tips is encouraged. To treat the wall void, consult sections of this label appropriate to the element of construction, FOAM APPLICATIONS OR CONTROL, OR WOOD INVESTING PESTS for detailed directions on any of these treatment procedures.
DO NOT MAKE TREATMENT UNTIL LOCATION OF HEAT OR AIR CONDITIONING DUCTS AND VENTS ARE KNOWN AND IDENTIFIED. USE EXTREME CAUTION TO NOT CONTAMINATE DUCTS AND VENTS. Plug and fill all drilled holes in commonly occupied areas with suitable sealant. Flaps must be of non-cellulosic material or covered by an impermeable, non-cellulosic material.

2. HOLLOW BLOCK FOUNDATION OR MASHERY Voids: Termites actively located within hollow-block foundations or masonry voids must be treated. Spot treatment at the site of termite activity must extend a minimum of 3 feet on both sides. Void masonry voids by applying 2 gallons of solution per 10 linear feet to an entire part of the void so that it reaches the top of the footings or soil. Drill spacing in masonry voids must be at intervals not to exceed 16 inches, streets may vary as necessary to check state regulations which may apply. To minimize dispersion of treatment solution in voids, the use of foam and directional dispersal tips is encouraged. To treat structural voids above sides of termite activity in masonry, consult and/or follow the label appropriate to the element of construction. FOAM APPLICATIONS OR CONTROL OF WOOD INFEADING PESTS for detailed directions on any of these treatment procedures.

Treatment of voids in brick or rubble foundation walls must be clearly examined. Applicators must inspect areas of possible runoff as a precaution against application leakage in the treated areas. Some areas may not be treatable or may require mechanical treatment prior to treatment. All leaks resulting in the deposition of termiticide in locations other than those prescribed on this label must be cleaned up before leaving the application site.

RESTRICTION:

Do not allow people or pets to contact or reoccupy the contaminated areas of the structure until the clean up is completed.

3. BATH TRAPS: If termite activity is observed within 2 feet of the bath trap, then exposed soil or soil covered with tar or a similar type of resilient around the plumbing and/or drain pit entry areas must be treated. Tar or asphalt may have to be removed to allow for adequate soil treatment. An access door or inspection portal should be installed if one is not present. After inspection and removal of any wood or cellulose debris, the soil can be treated by applying or placing the soil into a volume of at least 3 gallons of solution per square foot.

4. SHOWER OR FLOOR DRAIN: If termite activity is observed within 2 feet of a shower or floor drain in the slab, then soil beneath the drain must be treated. Drill through the slab adjacent to the drain and use sub-slab injection to apply solution to the soil. Multiple access points may be drilled adjacent to the drain. Treat soil as a volume of 1 gallon of solution per square foot.

FOAM APPLICATIONS

Construction practices, soil maintenance and other factors may create situations in which a continuous chemical treated zone cannot be achieved using conventional treatment alone. In situations where necessary, conventional application methods can be supplemented through use of foam generating equipment, or similar devices, to provide a continuous treated zone.

Foam application may be made alone or in combination with conventional application methods, provided that the labeled amount of active ingredient per unit area is used.

Foam Application Use Directions: Mix solution of 1 Maxpro Insecticide in Water Soluble Packets with manufacturer’s specified volume of foaming agent (see table for foaming instructions). Apply a sufficient volume of 1 Maxpro Insecticide in Water Soluble Packets foam alone or in combination with liquid solution to provide a continuous treated zone at the specified rate for specific application sites. Use appropriate dispersion tips and application method for site.

(a) Add the manufacturer’s specified quantity of foam agent to the 1 Maxpro Insecticide In Water Soluble Packets solution.

Depending on the circumstances, foam applications may be made alone or in combination with liquid solution applications. Applications may be made behind wainscots, furring strips, dry wall, walls, ceilings, tiles, or in the soil in crawlspaces, and other similar locations.

Foam and liquid applications must be consistent with volume and active ingredient instructions in order to ensure proper application has been made. The volume and amount of active ingredient are essential to an effective treatment. At least 75% of the gallons of 1 MaxPro Insecticide in Water Soluble Packets must be applied as a liquid treatment. The remaining 25% or less gallons are delivered to appropriate locations using a foam application.

When foam is used solely to kill subterranean termites in above ground locations (such as felling galleries in wooden framing, or in voids between wooden structural members) or above ground soil voids, 1 MaxPro Insecticide in Water Soluble Packets must be applied as a liquid treatment. The remaining 25% or less gallons are delivered to appropriate locations using a foam application.

CONTROL OF WOOD INFEADING PESTS

For control of above ground termites and carpenter ants in localized areas, apply 0.05 to 0.1% solution or sufficient volume of 1 MaxPro Insecticide in Water Soluble Packets to voids and galleries in damaged wood, and in spaces between wooden structures and between the soil and foundation where wood is vulnerable. Applications may be made to inaccessible areas by drilling, and then injecting the suspension or foam into the damaged wood or soil voids. Termites damage in building voids may be injected with 0.05 to 0.1% suspension or foam. Multiple injection points to varying depths may be necessary. It is desirable to physically remove damaged nest material from building voids where such nests are found. Applications to attic, crawl spaces, unfinished basements, or man-made voids may be made with a concentric spray of 0.05 to 0.1% solution or foam to control exposed worker and winged reproductive forms of termites or carpenter ants. This type of application is intended to be a supplemental treatment for control of above ground subterranean termites and carpenter ants.
It is recommended to remove or prune away any shrubbery, bushes, and tree branches touching the structure. Vegetation touching the structure may offer a route of entry for ants into the structure. This may allow ants to inhabit the structure without coming in contact with the treatment. If nests are present, retreated treatment of 1 MaxPro Insecticide in Water Soluble Packets can be made to these nests.

Use a 0.05 to 0.1% solution to control existing infestations of or to prevent infestation by termites or carpenter ants in trees, utility poles, fencing and decking materials, landscape timbers and similar non-structural wood-to-soil contacts. If possible, locate the interior related active and inject a 0.05 to 0.1% solution or sufficient volume of 1 MaxPro Insecticide in Water Soluble Packets foam using an appropriate treatment tool with a foaming head. These non-structural wood-to-soil contacts may also be treated by applying a solution to the soil as a spot application or continuous treated zone applied as a drench or by running into the base of the post(s) or soil contact(s). Rod holes should be placed approximately 3 inches away from the soil contact points and spaced no more than 18 inches along the perimeter of the soil contact(s). For small piles or posts (< 6 inches in diameter), apply 1 gallon per 10 linear feet per foot of depth. For larger constructions, apply 4 gallons per 10 linear feet per foot of depth. Retreated as needed to maintain protection. Termite colonies in trees may be injected with a 0.05 to 0.1% solution or sufficient volume of foam using a point injection tool. Multiple injection points to varying depths may be necessary. Retreatment of termite material from bees is desirable but may not be necessary when termite application is used. In some instances, a pre-treatment application of a 0.05 to 0.1% solution applied to soil around the root flare of the tree may be necessary to prevent infestation by termites in the soil. For small trees (< 6 inches in diameter), apply 1 gallon of solution. For larger trees, apply 4 gallons per 10 linear feet (measured as the circumference at the root flare).

For protection of firewood or other wood products stored in contact with soil from carpenter ants and termites, treat soil prior to stacking with a 0.05 to 0.1% solution of 1 gallon per 10 square feet to prevent infestation. Curative application to the soil around firewood or other wood products stored in contact with soil may be made as described for non-structural wood-to-soil contacts above.

Drywood termites and wood-boring beetles or borers (such as, but are not limited to, powder post beetles, antler or deathwatch beetles, false powder post beetles, old house borers, whorl borers, or redbor or bark beetles). Galleries and structure voids can be treated with saturates, mists, or foams of a 0.05 to 0.1% MaxPro Insecticide in Water Soluble Packets solution. Locate galleries by using visual signs (frass or pellets), shoddy wood, emergence or dead cut trees, the presence of live insects, mechanical sounding techniques, or listening devices (e.g., stethoscopes, acoustic emission detectors). Perforate the gallery system by drilling holes to receive the injection tool or treatment tool. Distribute still chips to adequately cover the gallery system. (Do not drill where electrical wiring, plumbing lines, etc. are located). Apply 1 MaxPro Insecticide in Water Soluble Packets solutions as a low pressure (about 20 psi) spray or by misting or, where appropriate, by foaming. It is not necessary to treat the soil under the treated building. Do not apply where electrical shock hazards exist. Drill holes should be sealed with a water-resistant sealant. Also, wood surfaces can be sprayed or mixed with a 0.05 to 0.1% solution or, where appropriate, up to a sufficient volume of foam. For inaccessible places, test the interior of structural voids. Surfaces treated may include untreated wooden surfaces in crawlspaces, basements, or attics, wooden exterior surfaces such as decks, fencing, or siding, structural voids, cleanouts in damaged wood. In spaces between wooden members of a structure, and junctions between wood and foundations. Apply by blowing as a mist, or by a coarse pressure (about 20 psi) spray to the wood surface; apply sufficient volume to cover the surface of the point of weakness, but do not apply to the point of runoff. When spraying overhead in living areas, cover surfaces below the treated area with plastic sheeting or similar material. Do not contact treated surfaces until spray deposits have dried. Retreated as needed to maintain protection.

Localized treatment for carpenter bats: Apply a 0.05 to 0.1% solution as a spray or mist, or sufficient volume of foam, directly into gallery entrance holes. Following treatment, entrance holes may be plugged with small pieces of clean wood or similar material.

RETREATMENT

Retreatment for subterranean termites cannot be performed if there is clear evidence of reinestation or disruption of the treated zone due to construction, excavation, or landscaping and/or evidence of the breakdown of the termite treated zone. These vulnerable or non-termite areas may be retreated in accordance with application techniques described in this product's labeling. The timing and type of these retreatments will vary, depending on factors such as termite pressure, soil types, soil conditions and other factors which may reduce the effectiveness of the treated zone. Retreatment may be made as either a spot or complete retreatment. When a structure is not known to be weakened and the treated zone is not disturbed, but where the structure was last treated five or more years ago, a retreatment may be performed if, in the judgement of the applicator, it is necessary to ensure adequate protection of the structure. In determining the timing of any retreatment, the applicator should consider efficacy and degradation data and site-specific conditions and previous experience that indicate a vulnerability of the structure to termite attack.

Annual retreatment of the structure is prohibited unless there is clear evidence that reinestation or treated zone disruption has occurred.

When another registered termite control product is used as the primary treatment for prevention or control of subterranean termites and is applied to all labeled specified areas, 1 MaxPro Insecticide in Water Soluble Packets may be applied as a spot application in a secondary treatment to critical areas of the structure including plumbing and utility entry sites, both sides, expansions joints, foundation correction, the outside foundation wall areas of known or suspected activity at either a pre-construction or post-construction timing. These secondary treatments must be applied in amounts and concentrations in accordance with labeled directions relative to the treated areas to receive the secondary treatment. For control of ants in houses and other structures, apply a 0.05 to 0.1% solution as a general surface, spot, crack and crevice neat call or wall void application. Apply to surfaces on buildings, porches, patios and other structures, around doors and windows, eaves and attic vents, utility entry points, attic areas and other exterior openings (including foundation wall or slab) where these pests enter the structure or where they crawl or hide. Spray into cracks and crevices, spray mist or foam into voids where these pests or their nests are present. Apply the volume of spray mist or foam sufficient to cover the area, but do not allow excessive dripping or run-off to occur from vertical or overhead surfaces. Treat soil, turf or ground cover adjacent to the structure where ants are trailing or may find food or harborage. To control ants tunneling in soil apply a 0.05 to 0.1% solution as a drench or soil injection in alleys to establish a continuous treated zone. Treat along the edge of walls, swampland, or other soft surfaces where ants are tunneling beneath the surface.

Aerial feeds: If nests are located in tree hollows or non-structural wooden construction (e.g., posts, fences, decks) treat the interior cavity and/or the nest site by injecting a 0.05 to 0.1% solution as a spray mist, or sufficient volume of foam. If sufficient water to cover the foliage and soil area being treated. Maximum application is once per month to maintain control. Do not allow residue to pass into the immediate area during the application or contact with treated areas until spray has dried. Interior applications for ant control are limited to spot, crack and crevice, or wall void applications only. Where severe pest pressures may exist and where rapid knockdown or exclusion at pest entry points is desired, supplemental treatments using 1 MaxPro Insecticide in Water Soluble Packets with targeted applications of a cyperometro such as TEMPO®-SC, ULTRA or SUSTADIN®-SC to doors and windows, utility entry points, and other places where these pests enter the structure. Read and follow all label directions for use of this companion product.
RESTRICTIONS
Do not use this product against native or imported fire ants, pharaoh or harvester ants.
Do not apply solution until location of heat pipes, ducts, water and sewer lines and electrical conduits are known and identified. Caution must be taken to not puncture or inject into these structural elements.
Do not treat within a distance of one foot out from the drip line of edible plants.
Do not contaminate public and private water supplies.
Do not formulate this product into other end-use products.
Do not apply at a lower dosage and/or concentration than specified on the label.

PRECAUTIONS FOR APPLICATIONS
After treatment, plug and fill all holes drilled in concrete slate areas of the building with a suitable sealant.
Use anti-backflow equipment or an air gap on filling hoses.
Consult State, Federal, or Local authorities for information regarding the approved treatment practices for areas in close proximity to water supplies.

STORAGE AND DISPOSAL
Do not contaminate water, food, or feed by storage or disposal.
Do not store in metal or plastic containers.
Do not store in open containers.
Do not store in a location where it can be easily reached by children.
Do not store in a location where it can be easily reached by livestock.
Do not store in a location where it can be easily reached by pets.
Do not store in a location where it can be easily reached by other animals.

IMPORTANT: READ BEFORE USE
Read the entire Directions for Use, Conditions, Disclaimer of Warranties and Limitations of Liability before using this product.
