MasterLine®
I MaxxPro® 2F
Insecticide

For use by individuals licensed or registered by the state to apply termicide products. States may have more restrictive requirements regarding qualifications of persons using this product. Consult the structural pest control regulatory agency of your state prior to use of this product.
For prevention or control of subterranean termites, drywood termites, dampwood termites, carpenter ants, and other wood-infesting insects.

ACTIVE INGREDIENT:

INERT INGREDIENTS: ................................................................. 21.4% 
Total: .............................. 78.6% 

Contains 2 pounds of insecticide per gallon. Shake well before using.

STOP - READ THE LABEL BEFORE USE.
KEEP OUT OF REACH OF CHILDREN.

FIRST AID

IF SWALLOWED:
• Call a poison control center or doctor immediately for treatment advice.
• Have person rinse mouth and swallow 1-2 glasses of water if able to swallow.
• Do not induce vomiting unless told to do so by a poison control center or doctor.
• Do not give anything by mouth to an unconscious person.

IF ON SKIN OR CLOTHING:
• Take off contaminated clothing.
• Rinse skin immediately with plenty of soap and water for 15 to 20 minutes.
• Call a poison control center or doctor for treatment advice.

IF IN EYES:
• Hold eyelids open and rinse slowly with water for 15 to 20 minutes.
• Remove contact lenses, if present, after the first 5 minutes, then continue rinsing.
• Call a poison control center or doctor for treatment advice.

NOTICE TO PHYSICIAN: No specific antidote is available. Treat patient symptomatically.

PRECAUTONARY STATEMENTS
HAZARDS TO HUMANS AND DOMESTIC ANIMALS
CAUTION

Hazards include inhalation, ingestion, or absorption through skin. Avoid contact with skin, eyes, or clothing. Wash thoroughly with soap and water after handling. Remove contaminated clothing and wash before reuse. Keep children or pets away from treated area until dry.

WHEN TREATING ADJACENT TO AN EXISTING STRUCTURE, THE APPLICATOR MUST CHECK THE AREA TO BE TREATED, AND IMMEDIATELY ADJACENT AREAS OF THE STRUCTURE, FOR VISIBLE AND ACCESSIBLE CRACKS AND HOLES TO PREVENT ANY LEAKS OR SIGNIFICANT EXPOSURE TO PERSONS OCCUPYING THE STRUCTURE. PEOPLE PRESENT OR RESIDING IN THE STRUCTURE DURING APPLICATION MUST BE ADVISED TO REMOVE THEIR PETS AND THEMSELVES FROM THE STRUCTURE IF THEY SEE ANY SIGNS OF LEAKAGE. AFTER APPLICATION, THE APPLICATOR IS REQUIRED TO CHECK FOR LEAKS. All leaks resulting in the disposal of terminate in locations other than those prescribed on this label must be cleaned up prior to leaving the application site.

Do not allow pets or people to contact contaminated areas or to reenter contaminated areas of the structure until the clean up is completed.

PERSONAL PROTECTIVE EQUIPMENT:

All pesticide handlers, drivers, loaders, and applicators must wear long-sleeved shirt and long pants, shoes, socks, and chemical-resistant gloves made of waterproof material such as tar- nier laminate, heavy rubber, nitrile rubber, neoprene rubber, polyethylene, polyvinyl chloride, or other. After the product is handled in accordance with label directions for use, use of gloves, pants, socks, and shoes must be worn. In addition, all pesticide handlers must wear protective eyewear when working in a non-ventilated space or when applying the termiticide by the soil drench or sub-slab injection.

ENVIRONMENTAL HAZARDS

This product is highly toxic to aquatic invertebrates. Do not apply directly to water, to areas where surface water is present or to intertidal areas below the mean high water mark. Do not contaminate water when dispersing equipment washwaters. Apply this product as specified in this label. Extreme care must be taken to avoid runoff. Apply only to soil or other fill substrate that will accept the solution at the specified rate. Do not allow soil that is water-saturated or frozen or in any conditions where run-off or movement from the treatment area is likely to occur.

DIRECTIONS FOR USE

It is a violation of Federal law to use this product in a manner inconsistent with its labeling. Structures that contain wells or systems within the foundation of the structure can only be treated using the treated backfill method described in the treat area around wells and systems of the structure. Consult state and local specifications for recommended distances of wells from treated areas, or if such regulations do not exist, refer to Federal Housing Administration Specifications (N.U.D.) for guidance.

Do not formulate this product into other over-the-counter products.

MIXING: Refer to Mixing Table for proper amount of MaxxPro Pro 2F Insecticide to be used. Mix the termiticide use dilution in the following manner:

1 part water: 1 part termiticide

08/2013
CONTROL - GENERAL

Treatment standards for Mediterranean termite control may vary due to regulations, treatment procedures, soil types, construction practices and other factors. The purpose of chemical soil treatment for termite control is to establish a continuous chemical treated zone (horizontal and/or vertical as needed) between the wood and other cellulose material in the structure and the termite colony in the soil. Follow all federal, state, and local regulations and treatment standards for protection of a structure from termites in some instances where an exterior or above ground colony is established. Supplemental treatments to control the termites, landscape modifications, and/or structural repairs may be needed to degrade termites of a moisture source. Use a 0.005 to 0.01% dilution based on local recommendations. Generally, a 0.005% dilution is used for typical control situations. Where severe or persistent infestations occur, a 0.01% dilution may be used.

PRE-CONSTRUCTION TREATMENT

Do not apply at a lower dosage and/or concentration than specified on the label for application prior to installation of the finished grade. Prior to each application, applicators must notify the general contractor, construction superintendent, or another responsible party of the intended termite control application and intended rates of application and instruct the responsible party to notify construction workers and others individual to the area to be treated during application and until the termiticide is absorbed into the soil.

CONCRETE SLAB-ON-GROUND OR BASEMENTS:

Apply an overall treatment to the entire surface of soil or other substrate to be covered by the slab including areas to be under carparks, porches, basement floor and entrance platters. Apply at the rate of a gallon of solution per 10 square feet. Fill under slab to grading or other coarse aggregate, apply at the rate of 1.5 gallons or sufficient volume of solution to accuracy and uniformly cover 10 square feet. In addition, apply 4 gallons of solution according to APPLICATION VOLUMES per 10 linear feet to provide a uniform treated zone in soil in critical areas such as areas along the inside of foundation walls, and around plumbing, drain traps, utility services, and other features that will penetrate the slab. After completion of grading, make an application by trenching or trenching and nodding around the slab or foundation perimeter. Rooting may be done from the bottom of a shallow trench. Trenching, root holes must be spaced in a manner that will allow for a continuous chemical treated zone, not to exceed 12 inches, to be developed along the treated area. Root holes should not extend below the finishing depth. Use 4 gallons of solution according to APPLICATION VOLUMES per 10 linear feet, per foot of depth to provide a uniform treated zone. Rooting may be done from the bottom of a shallow trench around the foundation walls, around pipes, and around plumbing and utility services. Apply 4 gallons of solution according to APPLICATION VOLUMES per 10 linear feet per foot of depth to provide a uniform treated zone. Rooting may be done from the bottom of a shallow trench to top of the footing or a minimum of 4 feet. When rooting, root holes must be spaced in a manner that will allow for a continuous chemical treated zone to be developed along the treated area. Root holes should not extend below the footing. When trenching, the trench should be a minimum of 6 inches wide and 6 inches deep. Use a low pressure spray to form the spray which will be placed in the trench, mixing the spray solution with soil as it is being placed in the trench. HOLLOW BLOCK FOUNDATIONS OR Voids:

Hollow block foundations or voids in masonry footing on the footing may be treated to provide a continuous chemical treated zone in the voids at the footing. Apply 2 gallons of solution per 10 linear feet to the lower part of the void so that it reaches the top of the footing or soil. Treatment of voids in block or rubble foundation walls must be closely examined. Application must respect areas of possible soil as a precaution against application leakage in the treated areas. Some areas may not be treatable and may require mechanical alteration prior to treatment. All labor resulting in the deposition of termiticide in locations other than those prescribed on this label must be thoroughly cleaned up prior to leaving the application site. Do not allow people or pets to contact or enter the treated areas of the structure until the cleanup is completed.

POST-CONSTRUCTION TREATMENT CONCRETE SLAB-ON-GROUND: To apply a treatment under the slab, including attached porches, carports, entrance platters, garages and similar slab structures. It may be necessary to drill through the slab or exterior foundation. Drill holes should be spaced in a manner that will allow for application of a continuous chemical treated zone. Treat all existing cracks and cuts, communication or expansion joints. Also, treat around all pipes, plumbing and utility services which penetrate the slab. Apply 4 gallons of solution (see APPLICATION VOLUMES) per 10 linear feet per foot of depth to provide a uniform treated zone. DO NOT MAKE TREATMENT UNLESS THE LOCATION OF HEAT OR AIR CONDITIONING DUCTS AND VENTS ARE KNOWN AND IDENTIFIED. USE EXTREME CAUTION TO AVOID CONTAMINATION OF DUCTS AND VENTS. Plug and fill all drilled holes in a manner that is acceptable and with a suitable sealant. Plug must be made of non-cellulose material or covered by an impermeable non-cellulose material. An application should be made by trenching or trenching and nodding around the outside of the foundation wall. Apply 4 gallons of solution (see APPLICATION VOLUMES) per 10 linear feet per foot of depth to provide a uniform treated zone. When trenching, the trench should be a minimum of 6 inches wide and 6 inches deep. Use a low pressure spray to form the spray which will be placed in the trench, mixing the spray solution with soil as it is being placed in the trench.
shallow trench. When rodding, rod holes should be spaced in a manner that will allow for a continuous chemical treated zone, not to exceed 12 inches, to be deposited along the treated area. Rod hole depth should not exceed 6 inches.

BASALT TRAPS: Exposed soil or soil covered with tar or a similar type asphalt beneath and around plumbing and drain pipe entry areas should be treated with 3 gallons of solution per square foot. An access door or inspection vent should be cut and installed, if not already present. After inspection and removal of any wood or cellulose materials, the soil can be treated by rodding or spraying the soil.

CRACKS, SPACES: Where there is insufficient clearance between floor joists and ground surfaces to allow applicators access, excavate, if possible, and treat according to crawl spaces (refer to Pre-Construction Treatment). If it is not feasible to excavate, crawl space soil and wood treatment may be used to prevent surface access by termites. Apply 1 gallon of solution (see APPLICATION VOLUME) per 10 square feet to provide a uniform chemical treated zone. Use a very coarse spray at a pressure not exceeding 25 psi at the treatment tool when the valve is open.

Where a crawl space cannot be reached with the application wand, use extension wands or other suitable equipment to apply a coarse spray on the soil, wood and structural members contacting the soil at the lowest rates. Do not apply to inaccessible crawl space areas using pressure greater than 25 psi at the treatment tool when the valve is open.

Treatment may also be made by filling through the foundation wall or through the floor above and treating the soil perimeter at a rate of 1 gallon of solution per 10 square feet. Crawl space must be at intervals not to exceed 16 inches. Many states have smaller intervals to check state regulations which may apply.

To prevent subterranean termites from constructing mud tubes between soil and crawl space wood members above, an overall soil treatment of this product may be applied. Remove all cellulose debris before application. Apply 1 gallon of solution (see APPLICATION VOLUME) per 10 square feet to provide a uniform chemical treated zone.

SHALLOW FOUNDATIONS: For shallow foundations, one foot or less in depth, dig a narrow trench approximately 6 inches wide and deep along the outside and inside of the foundation walls, being careful not to dig below the bottom of the footing. For foundations with exposed footings, dig a trench alongside the footing taking care not to undermine the footing. Apply 4 gallons of solution (see APPLICATION VOLUME) per 10 linear feet to the top of the footing to provide a uniform treated zone. The mixture should be applied to the trench and mixed with the soil as it is placed in the trench.

BASEMENTS- OUTSIDE PERIMETER: Along the outside of the exterior walls, an application must be made by trenching or riddling within the trench. Riddling depth should be to the top of the footing or a minimum of 4 feet or according to state or local regulations. When trenching or trenching a trench, dig a narrow trench about 5 inches wide and 6 inches deep. Apply 4 gallons of solution (see APPLICATION VOLUME) per 10 linear feet per foot of depth to provide a uniform treated zone by riddling through the trench. Use a fine spray at a pressure not exceeding 25 psi and place the soil back into the trench after riddling. Mix spray solution with the soil as it is being placed in the trench.

BASEMENTS- INSIDE PERIMETER: If necessary, treat by riddling along the perimeter of the interior walls. Applications also may be necessary around sewer pipes, floor drains, conduits, expansion joints, or cracks or holes in the basement floor. Apply 4 gallons of solution (see APPLICATION VOLUME) per 10 linear feet to provide a uniform treated zone with a depth of 6 inches or trenching and riddling where conditions permit or to the top of the footing. When conditions will not permit trenching or riddling, a surface application adjacent to interior foundation walls may be made, but the treated area shall not exceed a width of 15 inches, horizontally, from the foundation walls, piers, or pipes. The surface application will be made as a spot of 1.5 gallons of solution per 10 square feet as a very coarse spray under low pressure (not exceeding 25 psi). When measured at the treatment tool when water is on.

When treating piers, turn off the air circulation system of the structure until application has been completed and all terminating has been absorbed by the soil.

TREATMENT AROUND HEELS OR COLUMNS: Do not contaminate wall or cement.

Structures With Wall or Slab Foundations: Structures that contain wall or slabs within the foundation or a structure can only be treated using the following techniques:

1. Do not apply within 5 feet of any wall or column by rodding or melting or by the backfill method. Tread soil between 5 and 10 feet from the wall or columns by the backfill method only. Treatment of soil adjacent to water pipes within 5 feet of grade should only be done by the backfill method.
2. Trench and remove soil to be treated onto heavy plastic sheeting or similar material or into a mound.
3. Tread the soil at the rate of 4 gallons of solution per 10 linear feet per foot of depth of the trench by 1 gallon per 1 cubic foot of soil. Mix thoroughly into the soil taking care to contain the liquid and prevent run-off or siltage.
4. After the treated soil has absorbed the solution, replace the soil into the trench. When conditions will not permit trenching or riddling, a surface application adjacent to interior foundation walls may be made, but the treated area shall not exceed a width of 15 inches horizontally, from the foundation walls, piers, or pipes. The surface application will be made as a spot of 1.5 gallons of solution per 10 square feet as a very coarse spray under low pressure (not exceeding 25 psi) when measured at the treatment tool when water is on.

When treating piers, turn off the air circulation system of the structure until application has been completed and all terminating has been absorbed by the soil.

TREATMENT AROUND HEELS OR COLUMNS: Do not contaminate wall or cement.

Structures With Wall or Slab Foundations: Structures that contain wall or slabs within the foundation or a structure can only be treated using the following techniques:

1. Do not apply within 5 feet of any wall or column by rodding or melting or by the backfill method. Tread soil between 5 and 10 feet from the wall or columns by the backfill method only. Treatment of soil adjacent to water pipes within 5 feet of grade should only be done by the backfill method.
2. Trench and remove soil to be treated onto heavy plastic sheeting or similar material or into a mound.
3. Tread the soil at the rate of 4 gallons of solution per 10 linear feet per foot of depth of the trench by 1 gallon per 1 cubic foot of soil. Mix thoroughly into the soil taking care to contain the liquid and prevent run-off or siltage.
4. After the treated soil has absorbed the solution, replace the soil into the trench. When conditions will not permit trenching or riddling, a surface application adjacent to interior foundation walls may be made, but the treated area shall not exceed a width of 15 inches horizontally, from the foundation walls, piers, or pipes. The surface application will be made as a spot of 1.5 gallons of solution per 10 square feet as a very coarse spray under low pressure (not exceeding 25 psi) when measured at the treatment tool when water is on.

When treating piers, turn off the air circulation system of the structure until application has been completed and all terminating has been absorbed by the soil.

TREATMENT AROUND HEELS OR COLUMNS: Do not contaminate wall or cement.

Structures With Wall or Slab Foundations: Structures that contain wall or slabs within the foundation or a structure can only be treated using the following techniques:

1. Do not apply within 5 feet of any wall or column by rodding or melting or by the backfill method. Tread soil between 5 and 10 feet from the wall or columns by the backfill method only. Treatment of soil adjacent to water pipes within 5 feet of grade should only be done by the backfill method.
2. Trench and remove soil to be treated onto heavy plastic sheeting or similar material or into a mound.
3. Tread the soil at the rate of 4 gallons of solution per 10 linear feet per foot of depth of the trench by 1 gallon per 1 cubic foot of soil. Mix thoroughly into the soil taking care to contain the liquid and prevent run-off or siltage.
4. After the treated soil has absorbed the solution, replace the soil into the trench. When conditions will not permit trenching or riddling, a surface application adjacent to interior foundation walls may be made, but the treated area shall not exceed a width of 15 inches horizontally, from the foundation walls, piers, or pipes. The surface application will be made as a spot of 1.5 gallons of solution per 10 square feet as a very coarse spray under low pressure (not exceeding 25 psi) when measured at the treatment tool when water is on.

When treating piers, turn off the air circulation system of the structure until application has been completed and all terminating has been absorbed by the soil.
Structures With Adjacent Wells/Cisterns and/or Other Water Bodies: Applications must inspect all structures with nearby water sources such as wells, cisterns, surface ponds, streams, and other bodies of water and nuvi-
ate at a minimum, the treatment recommen-
dations listed below prior to making an appli-
cation.
1. Prior to treatment, if feasible, expose the water (p.e.) coming from the well to the structure, if the p(e) is enter the structure within 3 feet of grade.
2. Prior to treatment applications are advised to take precautions to limit the risk of applying the treatment into subsurface drains that could supply into any bodies of water. These precautions include evaluating whether application of the treatment to the top of the footer may result in contamination of the subsurface drain. Factors such as depth to the drain system and soil type and degree of compaction should be taken into account in determining the depth of treat-
ment.
3. When appropriate i.e., on the water side of the structure, the treated baking technique (described above) can also be used to mini-
imize off-site movement of termiticide.

Exterior Perimeter Interior Spot Treatment:
GENERAL INFORMATION
Exterior Perimeter/Interior Spot Treatment is an optional method of termite treatment only to be used in post-construction applications, after the final grade is established. Structural protection when using the Exterior Perimeter/Interior Spot Treatment is accomplished by 1) establishing a continuous treated zone around the entire exterior foundation wall of the building; and 2) spot-treating isolated areas on the building. The exterior foundation wall must be treated in the same manner as conventional FMU application. It is required
that a complete and continuous treated zone be achieved around the entire exterior perimeter, including any attached walls such as garages, breezeways, and porches. In addition, the treatment adjacent to the foundation. Interior spot treatments must then be made to any indoor areas where termite activity is present. Optional interior spot treatments may also be made to high-risk areas including, but not lim-
ited to, plumbing and utility penetrations (including both trash) along settlement cracks and expansion joints, and dirt-filled corners. Exterior Perimeter/Interior Spot treatment can be used either as a preventative treatment (before structural foundation occurs) or as a curative treatment (after structural foundation occurs) in existing structures. Preventative treatment does not include post-construction applications made to protect new construction. It is required that a thorough structural inspection be completed, before treatment, to locate all areas of active infestations. Spot treatment of all known sites of termite activity is required with this optional labeling. If no termite activity is observed inside the structure, interior spot treatments are not required. Do not apply at lower dosage and/or concentration than specified in the label.

EXTERIOR PERIMETER TREATMENT
It is required that all structures, regardless of the type of construction, be protected by estab-
ilishing a treated zone along the exterior perimeter of the foundation wall. Consult the OUTER FOUNDATION WALLS section of this label (see below) for detailed directions on this treatment procedure.
1. OUTER FOUNDATION WALLS: Application must be made by trenching, or where appro-
priate (see below) by fischering, or trenching and fisching from the bottom of the trench, toward the outside of the foundation wall. When trenching, excavate a trench along the outside foundation that is about 6 inches wide and 6 inches deep. Apply 4 gallons of solution (see APPLICATION VOLUME) per 10 linear feet per foot of depth to provide a uniform vertical treated zone.
   - For shallow foundations, one foot or less of depth, dig a narrow trench that does not exceed 6 inches wide and 6 inches deep along the outside of the foundation walls, being care-
ful not to dig below the bottom of the footings. For foundations with exposed footings, dig a trench alongside the footing taking care not to undermine the footing.
   - For basements and other foundations deeper than one foot, the application must be made by trenching and redirecting from the bottom of a shallow trench. When redirecting, no holes must be spaced in a manner that will allow for a continuous chemical treated zone. For foundations with exposed footings, dig a trench alongside the footing taking care not to undermine the footing.
   - For basements and other foundations deeper than one foot, the application must be made by trenching and redirecting from the bottom of a shallow trench. When redirecting, no holes must be spaced in a manner that will allow for a continuous chemical treated zone, and must exceed a minimum of 3 feet on both sides of the exterior walls. Apply 4 gallons of solution (see APPLICATION VOLUME) per 10 linear feet. Do not make treatment until location of HEAT OR AIR CONDITIONING DUCTS AND VENTS ARE KNOWN AND IDENTIFIED. USE EXTREME CAUTION TO AVOID CONTAMINATION OF DUCTS AND VENTS. Plug and fill all drilled holes in commonly occupied areas with suit-
able plaster. Holes must be of non-cellulosic material or covered by an impermeable, non-cellu-
lose material.

INACCESSIBLE CHAMPS: If termite activity is found along the perimeter wall or on a wall within an inaccessible crawl space, areas with termite activity must be treated. Apply 4 gallons of solution (see APPLICATION VOLUME) per 10 linear feet to create a vertical treated zone, which must extend a minimum of 3 feet on both sides of the exterior walls. Optional directions for horizontal fisching:
   - Treatment may also be made by drilling through the foundation wall (through the floor above) to treat the soil along the perime-
ter wall at a rate of 4 gallons of solution per 10 linear feet, Drill spacing must be at intervals not to exceed 16 inches. A28}
wall nor on pier within the inaccessible crawl space, to prevent subterranean termite form constructing mud tubes between soil in the crawl space and wooden elements in the structure. An overall soil treatment of this product may be applied. Remove all cellulose debris before application. Apply 1 gallon of solution (see APPLICATION VOLUME) per 10 square feet to provide a uniform chemical treated zone.

4. ACCESSIBLE CRAWL SPACE: If termite activity is found within an accessible crawl space, the area(s) where termite activity exists must be treated by trenching, or trenching and rodding from the bottom of the trench along the interior foundation walls, around posts, interior supports in contact with the soil, plumbing, or utility service access 4 gallons of solution (see APPLICATION VOLUME) per 10 linear feet, per feet of depth, to create a vertical treated zone, which must extend a minimum of 3 feet on both sides of the treated site. Rodding may be done from the bottom of a shallow trench to the top of the trench or to a minimum of depth of 4 feet. When rodding, rods must be spaced in a manner that will allow for a continuous treated zone, not to exceed 12 inches, to be deposited along the treated area. Rod holes must not extend below the footing. When trenching, a trench no more than 6 inches wide and 6 inches deep, using a low-pressure spray to treat soil which will be placed in the trench, mixing the soil with solution so it is being placed in the trench. INTERIOR SPOT TREATMENT

Targeted applications must be made to all known treated sites inside the structure. One or more of the following application methods must be used to make interior spot treatments:

- Sub-slab fumigations made through the slab at or near shop where termites are known to be present, or with the sub-slab fumigation made to open voids in the structure and/or at a near site of active infestations. Apply 4 gallons per 10 linear feet per feet of depth. Sub-slab fumigations must extend to a minimum of 3 feet on either side of every known infested site at expansion joints or cracks in slab.
- Sub-slab treatments using injection of sprays, mists or foams into above ground structural voids, termite control mists, and other injected locations.
- Wood treatments using injection techniques and/or surface applications, to treat active infestations in structural timbers.
- To maximize dispersion of treatment solution in soil and above ground locations, the use of foam and directional dispersion tips is encouraged for all interior spot treatments. Consult section(s) of this label appropriate to the element of construction, FOAM APPLICATIONS or CONTROL OF WOOD INFESTING PESTS for detailed information on any of these treatment procedures.

1. INTERIOR SLABS: When termite activity is located within an interior slab or structural member, the soil beneath the slab and the wall void at this site of activity must be treated. The source of infestation at an expansion joint, crack, through a utility penetration, or similar access point in the slab, must be treated by drilling and injecting through the slab. Deliveries in the slab must be spaced in a manner that will allow for application of a continuous chemical treated zone, which must extend a minimum of 3 feet on either side of the treated site. Apply 1 gallon of solution (see APPLICATION VOLUME) per 10 linear feet. To maximize dispersion of treatment solution in soil, the use of foam and directional dispersion tips is encouraged. To treat structural voids above sites of termite activity in masonry, consult section(s) of this label appropriate to the element of construction. FOAM APPLICATIONS or CONTROL OF WOOD INFESTING PESTS for detailed information on any of these treatment procedures.

Treatment of voids in block or rubble foundation walls must be closely examined. Applicators must inspect areas of possible entry as a precaution against application leakage in the treated areas. Some areas may not be treatable or may require mechanical disin- tation prior to treatment. All holes resulting in the dispersion of termiticide in locations other than those prescribed on this label must be cleaned up prior to leaving the application site prior to Treating. Applicators must not allow people or pets to contact or be exposed to the contaminated area of the structure until the clean up is complete.

3. BATH TRAPS: If termite activity is observed within 2 feet of the bath trap, then exposed shell or soil covered with tar or a similar type of insecticide around plumbing and chain drain entry areas must be treated. Tar or sediment may have to be removed to allow for adequate soil treatment. An access door or inspection port should be installed if one is not present. After inspection and removal of any wood or secu- rity doors, the hole can be treated by injecting or enroaching the shell of a volume of no less than 1 gallon of solution per square foot. 4. SHOWER OR FLOOR DRAIN: If termite activity is observed within 2 feet of a shower or floor drain in the slab, then shell beneath the drain must be treated. Drill through the slab adjacent to the hole and use sub-slab injec- tion to apply solution to soil. Multiple access points may be drilled adjacent to the drain. Treat shell at volume of 1 gallon of solu- tion per square feet.

FOAM APPLICATIONS

Construction practices, soil subsurface and other factors may create situations in which a continuous chemical treated zone cannot be achieved using conventional treatment alone. In situations where necessary, conventional applica- tion methods can be supplemented through use of foam generating equipment, or similar方法, to provide a continuous treated zone.

Foam application may be made alone or in combination with conventional application methods, provided that the total amount of active ingredient per unit area is a minimum.

Foam Application Use Directions: May appropria- tely concentrate of 1 MaxPro 2F insecticide in water and add the manufacturer’s recommended quantity of foam agent to the MaxPro 2F insecticide/water (see table for treatment recommendations). Apply a suffi- cient volume of 1 MaxPro 2F insecticide foam agent or in combination with liquid solution to provide a continuous treated zone at the recom- mended rate for specific application sites.

* Add the manufacturer's recommended quantity of foam agent to 1 MaxxPro 2F insecticide solution.

Depending on the circumstances, foam applications may be used alone or in combination with liquid solution applications. Applications may be made behind vines, trees, shrubs, fences, or other similar voids. Foam and liquid applications must be consistent with volume and active ingredient instructions in order to ensure proper application has been made. The volume and amount of active ingredient are essential to an effective treatment. At least 15% of the gallons of 1 MaxxPro 2F insecticide must be applied as a typical liquid treatment. The remaining 85% or less should be delivered to appropriate locations using a foam application.

NOTE: When foam is used to kill subterranean termites in above ground locations (such as feeding galleries in wooden framing, or in voids with infected soil), and when the targeted pest is other than subterranean termites (drywood termites, beetles, ants, etc.), diluted solutions of 1 MaxxPro 2F insecticide may be expanded by foaming without concentrating the 1 MaxxPro 2F insecticide solution as previously described for soil applications. Add the manufacturer's recommended volume of foam agent to produce foam of the desired expansion rate. Use application tips and methods suitable to the site and pest.

CONTROL OF WOOD INFESTING PESTS

For control of above ground termites and carpenter ants in localized areas, apply a 0.05 to 0.1% solution or sufficient volume of 1 MaxxPro 2F insecticide foaming foam to voids and galleries in damaged wood, and in spaces between wood structural members and the soil pile in foundation where the soil is vulnerable. Applications may be made to inaccessible areas by drilling, and then injecting the suspension or foam with a suitable directional injector into the damaged wood or soil voids. Termite control in buildings may be injected with a 0.25 to 0.1% suspension or foam. Multiple injection points to varying depths may be necessary. It is desirable to physically remove termites from material with building voids when such nests are found. Application to attic, crawl space, unframed basements, or eave voids may be made with a coarse fan spray of 0.05 to 0.1% solution or foam to control exposed worker and winged reproductive forms of termites or carpenter ants. This type of application is intended to be a supplemental treatment for control of above ground subterranean termites and carpenter ants. It is recommended to remove or prune away any structure, branches, and trees branches touching the structure. Vegetation touching the structure may offer a route of entry for ants into the structure. This may allow ants to inhabit the structure without coming in contact with the treatment. If nests are found, direct treatment of 1 MaxxPro 2F insecticide can be made to those nests.

Use a 0.05 to 0.1% solution to control existing infestations of or to prevent infestation by termites or carpenter ants in trees, utility poles, fencing and deck building materials, landscape timbers and similar non-structural wood-to-soil contacts. If possible, expose the interior infested cavity and inject a 0.05 to 0.1% solution or sufficient volume of 1 MaxxPro 2F insecticide using a foaming foam solution. For non-structural wood-to-soil contacts may also be treated by applying a solution to the soil as a soil application or continuous treatment zone applied as a slurry or by riddling around the base of the post or of soil contact). Rod holes should be placed approximately 3 inches away from the soil contact point(s) and spaced no more than 12 inches along the perimeter of the soil contact(s). For small poles or posts (< 6 inches in diameter), apply 1 gallon per foot of height. For larger constructions, apply 4 gallons per 10 linear feet of height. Refrain as needed to maintain protection.

Termite control in trees may be injected with a 0.05 to 0.1% solution or sufficient volume of foam using a foaming foam solution. Multiple injection points to varying depths may be necessary. Removal of termite material from trees is desirable but may not be necessary when foam application is used. In some instances, a perimeter application of a 0.05 to 0.1% solution applied to soil around the root flare of the tree may be necessary to prevent reinfection by termites in the soil. For small trees (< 6 inches in diameter), apply 1 gallon of solution. For larger trees, apply 4 gallons per 10 linear feet measured as the circumference at the root flare.

For protection of firewood or other wood products stored in contact with soil from carpenter ants and termites, treat soil prior to stacking with a 0.05 to 0.1% solution of 1 MaxxPro 2F insecticide to be applied to the soil and soil may be made as described for non-structural wood-to-soil contacts (above).

Drywood termites and wood-injuring beetles or borers (such as, but not limited to, powder post beetles, wood-boring woodworms, weevils, ants, termites, and carpenter ants) may be controlled as described for non-structural wood-to-soil contacts (above).
spaces, basements, or attics, wooden exterior surfaces such as decks, fencing, or siding, structural walls, fumigation in damaged wood, in spaces between wooden members of a structure, and junctions between wood and foundations. Apply for treating or as a coater. Use pressure-gram 20 psi spray to the wood surface, apply sufficient volume to cover the surface to the point of wetness, but avoid applying to the point of run-off. When applying overhead in living areas, cover surfaces below the treated area with plastic sheeting or similar material. Avoid contact with trap steel surfaces until spray dries have dried. Retreat as needed to maintain protection.

Localized treatment for carpenter bees: Applying a 0.3% to 0.5% solution as a spray or mist, or sufficient volume of foam, directly into gallery entrance holes. Treatment in galleries, entrance holes may be plugged with small pieces of other wood or similar material.

RETREATMENT
Retreatment for subterranean termites may only be performed if there is clear evidence of reinfection or disruption of the treated zone due to construction, excavation, or landscaping. Treatment is required if the breakdown of the termite-treated zone in the soil. These vulnerable or treated areas may be retreated in accordance with application techniques described in this product's labeling. The timing and type of these retreatments will vary depending on factors such as termite pressure, soil type, soil conditions and other factors, which may influence the effectiveness of the treated zone. Retreatment may be made at either a spot or complete treatment. When a structure is not known to be infested and the treated zone is not disturbed, the retreatment may be performed at the judicious of the applicator, it is necessary to ensure adequate protection of the structure. In determining the timing of any retreatment, the applicator should consider the efficacy of the current treatment and any prior treatments. This structure and the possibility of termite activity in the soil or the surrounding area. Annual retreatment of the structure is prohibited unless there is clear evidence that reinfection or treatment within the treated zone has occurred.

When another residual termite control product is used as the primary treatment for protection against subterranean termites, and is applied in all treated areas, ImanPro 2F in the treated zone may be applied as a soil application in a secondary treatment to critical areas of the structure including plumbing and utility entry points, tank bases, foundation walls, and areas of known or suspected activity or where post-construction or post-construction treatment. These secondary treatments must be applied in amounts and concentration in accordance with label directions relevant to the treatment areas to receive the secondary treatment.

For control of ants in basements and other structures, apply a 0.3% to 0.5% solution as a general surface, spot, crack, and crevice or wall void application. Apply to surfaces on buildings, porches, and other structures, around doors and windows, sills and attic vents, utility entry points, attics and other exterior openings (including foundation cracks or drilled holes) where pests enter the structure where they crawl or hide. Spray into cracks and crevices, spray mist or foam into voids where pests are present. Apply the volume of spray mist or foam sufficient to cover the area, but do not allow excessive dripping or runoff to occur from vertical or overhead surfaces.

Treat soil, turf, or ground cover adjacent to the structure where ants are treating or may find food or harborage. Apply to flowers, shrubs, ornamental plants, and trees adjacent to the structure where ants may find food or harbor. To control ants tunneling in soil apply a 0.5% to 0.1% solution as a soil injection at intervals to establish a continuous treated zone. Treat along the edge of walks, driveways, and other hard surfaces where ants are tunneling beneath the surface. Aerial nests that ant nests are located in tree hollows or non-structural wooden construction (e.g., posts, fences, decks) treat the interior cavities and the nest site by injecting a 0.1% to 0.1% solution as a spray mist, or sufficient volume of foam. Apply in sufficient water to cover the foliage and soil area being treated. Maximum application is once every month to maintain control.

Do not allow residents or pets to enter the treated area during the application or contact with treated areas until spray has dried. Interior applications for pest control are limited to spot, crack, and crevice, or wall void applications only.

Do not use this product against active or imported fire ants, pharaoh, or harvester ants.

NOTE: Where severe pest pressures may exist and where rapid knockdown or inclusion at pest entry points is desired, supplemental treatments using ImanPro 2F in the small spaces with targeted applications of a pyrethroid such as TEVAPO 5G ULTRA or GRANDPA 5G can be applied in doors and windows, utility entry points, and other places. Where pests enter the structure. Read and follow all label directions for use of this companion product.

GENERAL PRECAUTIONS FOR APPLICATIONS
After treatment, plug and fill all holes/gaps in concrete, brick, or stone masonry of the building with a suitably expanded material. Do not apply solution until location of heat pipes, ducts, water and power lines, and electrical conduit are known or identified. Caution must be taken to avoid puncturing and injection into these structural elements. Do not treat within a distance of one foot from the drip line of afflicted plants. Avoid contamination of public and private water supplies. Use and backflow equipment or an air gap on filling lines.

STORAGE AND DISPOSAL
Do not contaminate water, food, or feed by storing or disposing of pesticide residues. Pesticide Storage: Store in a cool, dry place and in such a manner as to prevent exposure to other pesticides, fertilizers, feed, and fuel. Handle and store in a manner as to prevent spillage. If the container is leaking, do not use it until it is repaired. If a spill occurs, do not contaminate water, food, or feed. Pesticide Disposal: Washes resulting from the use of this product may be disposed of on
**STORAGE AND DISPOSAL (continued)**

Store in the treatment area or at an approved waste disposal facility.

Non-refillable container: Do not repair or refill this container. After recycling, if available, three rinsed container (or equivalent) promptly after emptying.

Trip rinses as follows: Empty the remaining contents into applicable equipment or a rinse tank and drain for 10 seconds after the flow begins to drop. Fill the container 1/4 full with water and recaptcha. Shake for 10 seconds. Pour rinse into applicable equipment or a rinse tank or store for later use or disposal. Drain for 10 seconds after the flow begins to drop. Repeat the procedure two more times. Then offer for recycling or redistillation, or puncture and dispose of in a sanitary landfill, or by incineration; or, if allowed by State and local authorities, by burning, if burned, stay out of smoke.

**IMPORTANT: READ BEFORE USE**

Read the entire Directions for Use, Conditions, Disclaimer of Warranties and Limitations of Liability before using this product.

If terms are not acceptable, return the unopened product container at once. By using this product, user or buyer accepts the following Conditions, Disclaimer of Warranties and Limitations of Liability.

**CONDITIONS:** The directions for use of this product are believed to be adequate and must be followed carefully; however, because of manner of use and other factors beyond Union USA, Inc.'s control, it is impossible for Union USA, Inc. to eliminate all risks associated with the use of this product. As a result, crop injury or ineffectiveness is always possible. All such risks shall be assumed by the user or buyer.

Insecticide

For use by individuals/firms licensed or registered by the state to apply termicidie products. States may have more restrictive requirements regarding qualifications of persons using this product. Consult the structural pest control regulatory agency of your state prior to use of this product. For prevention or control of subterranean termites, drywood termites, dampwood termites, carpenter ants, and other wood-infesting insects.

ACTIVE INGREDIENT:
Methiocarb, 70% (1-C-[3-Chloro-3-germyl(methyl)-N-nitro-2-inkzalolinamine) 21.4%.

INERT INGREDIENTS: 
78.6%

Uses:
Contains 2 pounds of insecticide per gallon. Shake well before using.

EPA Reg. No. 432-1331-72746 EPA Est. No. 432-TX-1

STOP - READ THE LABEL BEFORE USE.
KEEP OUT OF REACH OF CHILDREN.
CAUTION
