To control Termites and General Household Pests indoors and around the exterior perimeter of residential, institutional, public, commercial, and industrial buildings.

When used as a termicide, individuals/firms must be licensed by the state to apply this product. States may have more restrictive requirements regarding qualifications of persons using this product. Consult the pest control regulatory agency of your state prior to use of this product.

KEEP OUT OF REACH OF CHILDREN
CAUTION

FIRST AID

If swallowed
• Call poison control center or doctor immediately for treatment advice.
• Have person sip a glass of water if able to swallow.
• Do not induce vomiting unless told to do so by the poison control center or doctor.
• Do not give anything by mouth to an unconscious person.

If inhaled
• Move person to fresh air.
• If person is not breathing, call 911 or an ambulance, then give artificial respiration, preferably by mouth-to-mouth, if possible.
• Call a poison control center or doctor for further treatment advice.

If on skin or clothing
• Take off contaminated clothing.
• Rinse skin immediately with plenty of water for 15-20 minutes.
• Call a poison control center or doctor for treatment advice.

If in eyes
• Hold eye open and rinse slowly and gently with water for 15-20 minutes.
• Remove contact lenses, if present, after the first 5 minutes, then continue rinsing eye.
• Call a poison control center or doctor for treatment advice.

HOTLINE NUMBER

Have the product container or label with you when calling a poison control center or doctor, or going for treatment. You may also contact 1-(800)-331-3148 for Emergency Assistance.

NOTE TO PHYSICIAN

This product contains a pyrethroid. If large amounts have been ingested, the stomach and intestine should be evacuated. Treatment is symptomatic and supportive. Digestible fats, oils, or alcohol may increase absorption and so should be avoided. All treatments should be based on observed signs and symptoms of distress in the patient. Overexposure to materials other than this product may have occurred.

For Information Regarding the Use of this Product: Call 1-800-321-FMC (362).

PRECAUTIONARY STATEMENTS

Hazards to Humans (and Domestic Animals)
CAUTION

Harmful if swallowed, inhaled or absorbed through skin. Avoid contact with skin, eyes or clothing. Avoid breathing spray mist. Wash thoroughly with soap and water after handling. Remove contaminated clothing and wash before reuse.

All pesticide handlers (mixers, loaders and applicators) must wear long-sleeved shirt and long pants, socks, shoes and chemical-resistant gloves. After the product is diluted in accordance with label directions for use, and/or when mixing and loading using a closed spray tank transfer system (such as U-Turn®), or an in-line injector system, shirt, pants, socks, shoes and water-proof gloves are sufficient. In addition, all pesticide handlers must wear a respiratory protection device when working in a non-ventilated space. All pesticide handlers must wear protective eyewear when working in non-ventilated spaces or when applying termicide by rodding or sub-slab injection.

Use one of the following NIOSH approved respirator with any R, P or HE filter or a NIOSH approved respirator with an organic vapor (OV) cartridge or canister with any R, P or HE filter.

When using as a termicide and treating adjacent to an existing structure, the applicator must check the area to be treated, as well as immediately adjacent areas of the structure, for visible and accessible cracks and holes to prevent any leaks or significant exposure to persons occupying the structure. People present or residing in the structure during application must be advised to remove their pets and themselves from the structure if they see any signs of leakage. After application, the applicator is required to check for leaks. All leaks resulting in the deposition of termicide in locations other than those prescribed on this label must be cleaned up prior to leaving the application site. Do not allow people or pets to contact contaminated areas or to recoup contaminated areas of the structure until the clean up is completed.

FMC Corporation
Agricultural Products Group
1735 Market Street
Philadelphia PA 19103

Net Weight: 7.5 ounce water soluble bags
Environmental Hazards
This pesticide is extremely toxic to wildlife, fish and aquatic invertebrates. Do not apply directly to water, to areas where surface water is present or to terrestrial areas near such areas. Do not apply on a day when the wind is blowing from treated areas may be hazardous to aquatic organisms in neighboring areas. Do not contaminate water when disposing of equipment wash waters. Care should be used when spraying to avoid fish and wildlife in or around ornamental ponds.

This product is highly toxic to bees exposed to direct treatment or residues on blooming crops or weeds. Do not apply this product or allow it to drift to blooming crops if bees are visiting the treatment areas.

Physical and Chemical Hazards
Do not apply water-based dilutions of Transport Termiticide Insecticide to electrical conduit, motor housing, junction boxes, switch boxes or other electrical equipment because of possible shock hazard.

DIRECTIONS FOR USE
It is a violation of Federal Law to use this product in a manner inconsistent with its labeling.

This product can also be used to control ants and a range of other general household pests outdoors around the exterior perimeter of buildings and structures.

STORAGE AND DISPOSAL
Pesticide Storage: Keep out of reach of children and animals. Store in original containers only. Store in a cool, dry place and avoid excess heat. Do not store at temperatures below 32°F (0°C). Rough handling may cause excessive resuspension of untreated powders. Allow warming above 50°F (10°C) before use. Do not allow inner bags to become wet during storage. Do not handle inner bag with hands or wet gloved. Do not put concentrate or diluted materials into food or drink containers. Do not contaminate other pesticides, fertilizers, water, food, or feed by storage or disposal.

In case of spill, avoid contact, isolate area and keep out children and unprotected persons. Contact a pest control professional.

To Contain Spill: If liquid, dilute surrounding area or absorb with sand, cat litter or commercial clay. If dry material, cover to prevent dispersal. Place damaged package in a holding container. Identify contents. Pesticide Disposal: Pesticide wastes are toxic. Improper disposal of excess pesticide, spray mixture, or rinse is a violation of Federal Law. Dispose of excess or waste pesticide by using according to label directions, or contact your State Pesticide or Environmental Control Agency, or the Hazardous Waste representative at the nearest EPA Regional Office for guidance.

Container Disposal: Non-refillable container. Do not reuse or refill this container. Offer for recycling, if available or dispose of empty outer pouch in the trash as long as water solubles bags were intact.

Subterranean Termite Control
Please note that annual inspections are recommended in any termite management program. The insecticidal dilution must be adequately dispersed in the soil to establish an effective barrier between the wood and the termites in the soil. For effective termite management the following cultural practices should be incorporated into the management program: 1) all non-essential wood and cellulose containing materials should be removed from around foundation walls, crawl spaces, and porches; 2) Replacing faulty plumbing and/or construction grade to eliminate termite access to moisture. Soil around untreated structural wood in contact with soil should be treated as described below.

To establish an effective insulations barrier with this product the service trench must be treated with termite control practices such as trenching, rodicing, sub-slab injection, crack and crevice (void) injection, excavated soil treatment, and brush or spray applications to infested or susceptible wood. These techniques must be correctly employed to control infestations by subterranean termites such as: Coptotermes, Heterotermes, Reticulitermes and Zoosomas. The biology and behavior of the species involved by the species involved will in determining which control practices to use to eliminate or prevent the termite infestation.

Large numbers of termites may be killed by the treatment of infested termite monitor staii, tree roots, stumps, fence posts, walls, wooden benches, planters, trellises, mailbox post, mulch and other infested materials. These treatments should not be considered as a replacement for a structural protection treatment tool as an augmentative. Choice of appropriate procedures should include consideration of such factors as the design of the structure, location of heating, ventilation, and air conditioning (HVAC) systems, water tables, soil type, soil compaction, grade conditions, and location and type of domestic water supplies and utilities.

For advice concerning current control practices with relation to specific local conditions, consult regional in structural pest control and state cooperative extension and regulatory agencies.

Important
Contamination of public and private water supplies must be avoided by following these precautions: Use anti-backflow equipment on all faucets. Do not contaminate cisterns or Wells. Do not use soil that is water saturated or frozen or in any condition where runoff or movement from the treatment area (site) is likely. Consult state and local specifications for recommended distances of wells from treated areas, or if such regulations do not exist, refer to Federal Water Administration Specifications for guidance.

Critical Areas
Critical areas include areas where the foundation is penetrated by utility services, cracks and expansion joints, bath traps and areas where cement constructions have been poured adjacent to the foundation such as slates, patios and slab additions.

Application Rate
One (1) 7.5 ounce WSP per 25 gallons of water. When properly mixed in water, the end use dilution after adding 1.5-ounce bag of Transport Termiticide Insecticide to 25 gallons of water for termites is 0.11% active ingredient.

Mixing Directions
Fill tank 1/4 to 1/3 full with water. Start pump to begin bypass agitate and place end of treating tool in tank to allow circulation though Transport Termiticide/Insecticide bag(s). Add remaining amount of water. Let pump run and allow recirculation through the hose for 2 to 3 minutes.

Transport Termiticide/Insecticide may also be mixed into full tanks of water, but requires substantial agitation to insure uniformity of the dilution.

To provide maximum control and protection against termite infestation, use the specified volume of the finished water dilution and active ingredient as set forth in the directions for use section of the label. If soil wetting is desired, the labeled application volume, the volume may be reduced provided there is a corresponding increase in concentration so that the amount of active ingredient applied to the soil remains the same.

Certain elements of a structure may not need to be treated, such as the drilling and treatment of basement slabs in northern states.

Application Volume
Large reductions of application volume reduce the ability to obtain a continuous treated zone. Variance is allowed when volume and concentration are consistent with label directed rates and a continuous treated zone can still be achieved. Where desirable for pre and post treatment, the volume of the Transport Termiticide Insecticide dilution may be reduced by 1/2 the labeled volume and doubling the amount of Transport Termiticide Insecticide. When volume is reduced, the hole spacing for sub-slab injection and soil rodding may require similar adjustment to account for lower volume disposal of the Insecticide in the soil.

After Treatment
All holes in commonly occupied areas into which Transport Termiticide Insecticide has been applied must be plugged. Plugs must be of a non-cellulosic material or covered by an impermeable, non-cellulosic material.

Pre-Construction Subterranean Termite Control
Effective pre-construction subterranean Termite Control is achieved by the establishment of vertical and horizontal insulating barriers using a 0.11% dilution of Transport Termiticide Insecticide (one (1) 7.5 ounce WSP per 25 gallons water).

Do not apply at a lower dosage and/or concentration than specified on this label for applications prior to the grade elevation of the structure.

When treating foundations deeper than 4 feet, apply the Transport Termiticide Insecticide as the boil is being replaced, or if the construction contractor fails to notify the applicator after the boil is replaced, treat the foundation walls to a minimum depth of feet after the boil has been installed. The applicator must trench the foundation walls to the depth of the foundation walls and up around the stumps and other foundation elements, at the ratio prescribed from grade to a minimum depth of feet. When the top of the footing is exposed, the applicator must treat the soil adjacent to the footing to a depth not to exceed the height of the footing. However, in no case should a structure be treated below the footing.
Create a horizontal barrier wherever treated soil will be covered by a slab, such as footing trenches, slab floors, carpentry, and the soil beneath slabs and other spaces. Apply 1 gallon of dilution per 10 square feet, to provide thorough and continuous coverage of the area being treated. For fill in wash gravel or coarse material, it is important that a sufficient amount of dilution be used to reach the soil substrate beneath the coarse fill. Applications should be made by a low-pressure spray (less than 50 p.s.i.) using a coarse spray nozzle. If the slab will not be poured the same day as treatment, cover treated soil with a waterproof barrier such as polyethylene sheeting. This is not necessary if foundation walls have been installed around the treated soil.

**Horizontal Barriers**

**Vertical Barriers**

Vertical barriers must be established in areas such as around the base of foundations, plumbing, utility entrances, back-filled soil against foundation walls and other critical areas. Apply 4 gallons of dilution per 10 linear feet per foot of depth from grade to top of footing to ensure complete coverage.

- When trenching and rodding into the trench, or trenching, it is important that the dilution reaches the top of the footing. Rod holes must be spaced so as to achieve a continuous termiteic barrier, but in no case more than 12 inches apart.
- Care should be taken to avoid soil washout around the footing.
- Trenches need not be wider than 6 inches. The dilution should be mixed with the soil so as to be replaced in the trench.
- For a monolithic slab, an inside vertical barrier may not be required. Hollow block voids may be treated at a rate of 2 gallons of dilution per 10 linear feet so that the dilution will reach the top of the footing.

Prior to each application, applicators must notify the general contractor, construction superintendent, or similar responsible party, of the intended termiteic application and intended sites of application and instruct the responsible person to notify construction workers and other individuals to leave the area to be treated during application and until the termiteic is absorbed into the soil.

**Post-Contraction Subterranee Termite Control**

Post-construction soil applications shall be made by injection, trenching and rodding into the trench or trenching, or coarse fan spray with pressures not exceeding 25 p.s.i. at the nozzle. Care should be taken to avoid soil washout around the footing.

- Do not apply dilution until location of walls, radiant heat pipes, water and sewer lines and electrical conduits are known and identified. Caution must be taken to avoid puncturing and injection into these elements.

**Important**

**Foundations**

For applications made after the final grade is installed, the applicator must ensure that the trench and rod into the trench or trench along the foundation walls at around pilasters and other foundation elements at the rate prescribed from grade to top of the footing. When the footing is more than 4 feet below grade, the applicator must ensure that the dilution is mixed with the soil so as to be replaced in the trench. However, in no case should a structure be treated below the footing.

**Vertical Barriers**

Vertical barriers may be established by sub-slab injection within the structure and trenching and rodding into the trench or trenching outside at the rate of 4 gallons of dilution per 10 linear feet per foot of depth. Special care must be taken to distributate the treatment evenly to establish a continuous barrier. Treatment should not extend below the bottom of the footing. Treat along the outside of the foundation and where necessary beneath the slab on the inside of the foundation walls. Treatment may also be required beneath the slab along both sides of interior footing-supported walls, one side of interior partitions and along all cracks and expansion joints. Horizontal barriers may be established where necessary by long-rodding or by grid patterns injection vertically through the slab.

- Drill holes in the slab and/or foundation to allow for the application of a continuous insecticide barrier.
- For shallow foundations (1 foot or less) dig a narrow trench approximately 6 inches wide along the outside of the foundation walls. Do not dig below the bottom of the footing. The dilution should be applied to the trench and soil at 4 gallons of dilution per 10 linear feet per foot of depth as the soil is replaced in the trench.
- For foundations deeper than 1 foot follow rates for baseements.
- Excavated soil and wood in both trenches should be treated with the dilution.

Where the footing is greater than 1 foot of depth from grade to the bottom of the foundation, application must be made by trenching and rodding into the trench, or trenching, at the rate of 4 gallons of dilution per 10 linear feet per foot of depth. When the footer is more than 4 feet below grade, the applicator must ensure that the dilution is mixed with the soil so as to be replaced in the trench. Sub-slab injection may be necessary along the inside of walls, along door and window trim, along baseboards, and partition walls, around pipes, conduits, pipes, and along both sides of interior footing-supported walls.

**Basements**

Drill and treat voids in multiple elements of the structure extending from the structure to the soil in order to create a continuous treatment barrier in the area to be treated. Apply at the rate of 1 gallon per 10 linear feet per foot of depth, using a non-pressure of less than 25 p.s.i. When using this treatment, access holes must be drilled below the soil plate and should be as close to the footing as practical. Treatment of voids in block or rubble foundation walls must be closely examined. Applications must inspect areas of possible runoff as a precaution against application leakage in the treated areas. Some areas may not be treatable or may require mechanical alteration prior to treatment.

**Masonry Voids**

If treatment must be made in difficult situations, along flutedstone or nibble walls, along faulty foundation walls, and around pipes and utility lines which lead downward from the structure to a well or pond, many treatments may be made in the following manner:

- Treat the soil at the rate of 4 gallons of dilution per 10 linear feet per foot of depth of the trench. Mix the dilution thoroughly into the soil taking care to prevent liquid from running off the soil.
- After the treated soil has absorbed the liquid dilution, replace the soil in the trench.

**Excavation Technique**

For crawl spaces, apply vertical termiteic barriers at the rate of 4 gallons of dilution per 10 linear feet per foot of depth from grade to the top of the footing, or if the footing is more than 4 feet below grade to a minimum depth of 4 feet. Apply by trenching and rodding into the trench, or trenching. Treat both sides of foundation and around all piers and pipes. Where physical obstructions such as concrete walls adjacent to foundation elements prevent treatment, treatment may be made by rodding alone. When the soil is being rodded prohibiting, rodding may be used. When the top of the footing is exposed, the applicator must treat the soil adjacent to the footing to a depth not exceeding the height of the footing. For foundations and/or piers, the soil must be treated to ensure adequate distribution and to prevent termite activity from running off. The dilution must be mixed with the soil as it is replaced in the trench.

1. Rod holes and trenches must not extend below the bottom of the footing.
2. Rod holes must be spaced so as to achieve a continuous termiteic barrier but in no case more than 12 inches apart.
3. Trenches must be a minimum of 6 inches deep or to the bottom of the footing, whichever is less, and not be wider than 6 inches. When trenching in slab or fill (compressed) soil, the trench must be spaced to ensure adequate distribution and to prevent termite activity from running off. The dilution must be mixed with the soil as it is replaced in the trench.
4. When treating piers or crawl spaces, turn off the soil circulation system of the structure until application has been completed and all termiteic has been absorbed by the soil.

**Slats**

For inaccessible interior areas, such as areas where there is insufficient clearance between floor joists and ground surfaces to allow operator access, excavate if possible, and treat according to the instructions for accessible crawl spaces. Otherwise, apply one or a combination of the following two methods:

1. To establish a horizontal barrier, apply to the soil surface, 1 gallon of dilution per 10 square feet overall using a nozzle pressure of less than 25 p.s.i., and a coarse application nozzle (e.g., Deiavan Type R) Raindrop, RD-7 or larger, or Spraying Systems Co. 8010LP TeeJet or comparable nozzle. For an area not accessible to the application wand, use one or more extension rods to make the application to the soil. Do not broadcast or power spray with higher pressures.

2. To establish a horizontal barrier, drill through the foundation wall or through the floor above and treat the soil perimeter at a rate of 1 gallon of dilution per 10 square feet. Drill spacing must be at intervals not to exceed 16 inches. Many States have smaller intervals, so check State regulations that may apply.

When treating plenums and crawl spaces, turn off the air circulation system of the structure until application has been completed and all termiteic has been absorbed by the soil.

Note: Crawl spaces are to be considered inside of the structure.
Termite Control

The purpose of the applications described below is to kill termites workers or winged reproductives that may be present at the time of treatment. These applications are intended as supplements to, and not substitutes for, mechanical alteration, soil treatment or foundation treatment.

Exposed Workers and Winged Reproductives

To control exposed workers and winged reproductive termites in the coniferous form of Transport Termite Insecticide as a pinstream, spot, or crevice spray on all sides of buildings, porches, wooden decks and patios, wooden fences around buildings, window frames, doorways, foundations, eaves, patios, garages, and other building areas where you find these pests. Spray infested areas until thoroughly wet, avoiding dripping and runoff. Applications may also be made in inaccessible areas by drilling and the injecting dilution or foam, with a suitable directional injector, into dam- aged wood or wall voids. All treatment holes drilled in construction elements in commonly occupied areas of structures should be securely plugged after treatment.

Termite Carton Nests in Building Voids

To control termite carton nests in building voids, apply 0.11% dilution of Transport Termite Insecticide as a liquid or foam using a pinpoint injection tool. Multiple injection points and varying depths of injection may be necessary to achieve control. When possible, the carton nest material should be removed from the building void after treatment.

Termite Carton Nests in Trees

Termite carton nests in trees may be injected with a dilution or sufficient volume of foam using a pinpoint injection tool. Multiple injection points to varying depths may be necessary. In some instances, a perimeter application of the dilution applied to soil around the base of the tree may be necessary to prevent reinfection by termites in the soil. Apply liquid or foam to the voids in the tree to fill the voids.

Sand Barrier Installation and Treatment

Termites can build mud tubes over treated surfaces as long as they have access to untreated soil and do not have to move Transport Termite Insecticide treated soil. Fill in cracks and spaces with builder’s or play box sand and treat the exposed exterior surfaces of the house with Transport Termite Insecticide. This sand should be treated as soil following the termite rate listed on the Transport Termite Insecticide label.

Structures with Adjacent Wells/Cisterns and/or Other Water Bodies

Applicators must inspect all structures with nearby water sources such as wells, cisterns, surface ponds, streams, and other bodies of water and evaluate, at a minimum, the treatment recommendations listed below prior to making an application.

1. Prior to treatment, if feasible, expose the water pipe(s) coming from the wall to the structure, if the pipe(s) enter the structure within 3 feet of grade.

2. Prior to treatment, applicants are advised to take precautions to limit the risk of applying the termiteicide into subsurface drains that could empy into any bodies of water. These precautions include evaluating whether application of the termiteicide to the top of the footer may result in contamination of the subsurface drain. Factors such as depth to the drain system and soil type and degree of compaction should be taken into account in determining the depth of treatment.

3. When appropriate (i.e., on the water side of the structure), the treated backfill technique (described in the Excavation Technique section above) can also be used to minimize off-site movement of termiteicide.

Prior to using this technique near wells or cisterns, consult state, local or federal agencies for information regarding approved treatment practices in your area.

Structures with Wells/Cisterns Inside Foundations

Structures that contain wells or cisterns within the foundation of a structure can only be treated using the following techniques:

1. Do not treat soil while it is beneath or within the foundation or along the exterior perimeter of a structure that contains a well or cistern. The treated backfill method must be used if soil is removed and treated outside of the foundation. The treated backfill technique is described as follows:
   a. Trench and remove soil to be treated onto heavy plastic sheeting or similar material or into a wheelbarrow.
   b. Treat the soil at the rate of 4 gallons of dilute solution per 10 linear feet per foot of depth in the trench, or 1 gallon per 1.0 cubic foot of soil. Mix thoroughly into the soil taking care to contain the liquid and prevent runoff or spillage.
   c. After the treated soil has absorbed the diluted solution, replace the soil into the trench.

2. Treat infested and/or damaged wood in place using an injection technique such as described in the Control of Wood Infesting Insects section of this label.

Application in Conjunction with the use of Termitc Baits

As part of the integrated pest management (IPM) program for termite control, Transport Termite Insecticide may be applied to critical areas of the structure including plumbing and utility entry sites, bath traps, expansion joints, foundation cracks and areas with known or suspected infestations as a spot treatment or complete barrier treatment. Applications may be made as described in the post-construction treatment section of this label.

Retreatment

Retreatment for subterranean termites can only be performed if there is clear evidence of reinfection or the barrier due to construction, excavation, or landscaping and/or evidence of the breakdown of the termite barrier in the soil. These vulnerable or reinfiltrated areas may be retreated in accordance with application technique described in this product’s labeling. The timing and type of these retreatments will vary depending on factors such as termite population, soil type, soil conditions and other factors that may reduce the effectiveness of the injected dilution. Annual retreatment of the structure is prohibited unless there is clear evidence that barrier reinstallation or barrier disruption has occurred.

Notes

All labels resulting in the deposition of terminicide in locations other than those prescribed on this label must be cleaned up prior to leaving the application site. Do not allow people or pets to contact contaminated areas or to resorb the contaminated areas of the structure until the clean up is completed.

When treating behind veneer casings, it should be taken not to drill beyond the veneer. If concrete blocks are behind the veneer, both the blocks and the veneer may be drilled and treated at the same time. Not for use in voids insulated with rigid foam insulation.

Foam Applications

The Transport Termite Insecticide dilution can be converted to foam with expansion characteristics from 2 to 40 times for localized control or prevention of pests including ants, bees, termites, wasps or other ants and/or termites harboring in walls, under slabs or other void areas.

Depending on the circumstances, foam applications may be used alone or in combination with liquid dilution applications. Applications may be made behind veneers, pliers, chimney bases, into subfloor foundations, into block voids or other voids in walls, under slabs, stumps, porches, or to the soil in crawlspace and other similar voids.

Foam and liquid application must be consistent with volume and active ingredient instructions in order to use proper application has been made. The volume and mix of active ingredients are essential to an effective treatment. If less than 75% of the labeled liquid dilution volume of product must be applied, with the same volume and mix of active ingredients as the application. Refer to label and use recommendations of the foam manufacturer and the blowing equipment manufacturer.

Fom applications are generally a good supplement to liquid treatments in difficult areas, but may be used alone in difficult areas. Use dry foam (2.5 or greater expansion ratio) for applications to wall voids and slab walls. Use wet foam (5:1 or lower expansion ratio) for applications to soil, including foundations to filled porches.

Application Under Slabs or to Soil in Crawlspace to Prevent or Control Termites and other pests

Application may be made using Transport Termite Insecticide foam alone or in combination with liquid dilution. The equivalent of at least 4 gallons of dilution per 10 linear feet (ver- tical barrier), or at least 1 gallon of dilution per 10 square feet (horizontal barrier) must be applied either as dilution, foam, or a combination of both.

General Household Pest Control - Outdoor

Pinstream, Spot, Crack and Crevice or Perimeter Treatment

Perimeter Treatment Application Rate

As a perimeter treatment, apply as a continual band up to 10 feet wide around the structure and upwards along the founda- tion to a height of up to 3 feet and around windows, doors, other penetrations and roof eaves. Apply 0.011% concentration of Transport Termite Insecticide in sufficient amount of water to create Dilution chart and apply application is to cover 1,000 square feet. Dilutions may be applied at either high or low volumes. Do not apply more than 0.11% finished dilution per 1,000 square feet.

Where to Apply

As a perimeter treatment, apply as a continual band up to 10 feet wide around the structure and upwards along the founda- tion to a height of up to 3 feet and around windows, doors, other penetrations and roof eaves. Apply 0.011% concentration of Transport Termite Insecticide in sufficient amount of water to create Dilution chart and apply application is to cover 1,000 square feet. Dilutions may be applied at either high or low volumes. Do not apply more than 0.11% finished dilution per 1,000 square feet.
Outdoor Ant Control

Apply Transport Termiteicide Insecticide as a presoak, spot, crack and crevice, or perimeter spray to carpenter ant trails around doors and windows, and other places where carpenter ants have been observed or are expected to forage. For best results, locate and treat carpenter ant nests. Apply a perimeter treatment using either low or high volume applications described in the General Household Pest Control - Outdoor section of this label. The higher dilutions and/or application volumes, as well as more frequent applications, may be necessary when treating concrete surfaces for ant control. Maximum control is generally achieved using the following procedure:

1. Treat new low volume applications, using 0.11% dilution per 1,000 square feet.
2. Treat porous surfaces and vegetation with high volume applications, using 0.11% dilution per 1,000 square feet.
3. Treat the trunks of trees that have carpenter ant trails or upon which carpenter ants are foraging using 0.11% dilution and apply this dilution to thoroughly wet the bark from the base of the tree to as high as possible on the trunk.

Nuisance Ants

Outdoor (including fire ants)

For best results, locate and treat ant nests. Apply Transport Termiteicide Insecticide as a presoak, spot, crack and crevice, or perimeter treatment to ant trails around doors and windows, and other places where ants have been observed or are expected to forage. Apply a perimeter treatment described in the General Household Pest Control - Outdoor section of this label. More frequent applications, may be necessary when treating concrete surfaces for ant control. Maximum control is generally achieved using the following procedure:

1. Treat non-porous surfaces with low volume applications, using 0.11% dilution per 1,000 square feet.
2. Treat porous surfaces and vegetation with high volume applications, using 0.11% dilution per 1,000 square feet.

Specific Pest Control Applications

Ant and Fire Ant Mounds

Breed mounds with 1-2 gallons of Transport Termiteicide Insecticide at a 0.11% dilution (see Dilution Chart) to each mound area by sprinkling the mound until it is wet and treat 3-feet out around the mound. Use the higher volume for mounds larger than 12”. For best results, apply in cool weather, such as in early morning or late evening hours, but not in the heat of the day.

Carpenter Ants

In trees, utility poles, fencing, deck materials, and similar structural members

Drill to locate the interior infested cavity and inject or foam the 0.11% dilution (see Dilution Chart) into the cavity using a sufficient volume and an appropriate treatment tool with a splashback guard.

Wood piles and stored lumber

To protect firewood or lumber from carpenter ants, make up a 0.11% dilution (see Dilution Chart) of Transport Termiteicide Insecticide and apply as a soil treatment to the soil beneath where the firewood or lumber will be stacked at the rate of one gallon of dilution per 8 square feet. Treated wood can be burned as firewood or used as lumber one month after treatment.

Underground Services

Underground Services such as: wires, cables, utility lines, pipes, conduits, etc. Services may be within structures or located outside of structures.

Soil treatment may be made using Transport Termiteicide Insecticide to prevent attack by Termites and Ants. Apply 2 gallons of 0.11% dilution (see Dilution Chart) per linear feet to the bottom of the trench and allow liquid to soak into the soil. Lay services on the treated soil and cover with approximately 2 inches of fill soil. Apply another 2 gallons per 10 linear feet over the soil surface to complete the treatment barrier. In wide trenches, only treat the soil in the area near the services. It is important to establish a continuous barrier of treated soil surrounding the services.

Where soil will not accept the above-labeled volume, 1 gallon of 0.11% dilution of Transport Termiteicide Insecticide may be used per 10 linear feet of trench both to the bottom of the trench and over the soil on top of the services.

Finish filling the trench with treated fill soil. The soil where each service protrudes from the ground may be treated by trenching to a depth of at least 12 inches into the soil.

Pests, Poles and Other Constructions

Create an insecticidal barrier in the soil around wooden constructions such as signs, fences and landscape ornamentation by applying a dilution.

Previously installed poles and posts may be treated by sub-surface injection or treated by gravity-flow through holes made from the bottom of a trench around the pole or post. Treat on all sides to create a continuous insecticidal barrier around the pole. Use 1 gallon of 0.11% dilution (see Dilution Chart) per foot of depth for poles and posts less than six inches in diameter. For larger poles, use 1.5 gallons of 0.11% dilution per foot of depth. Apply to a depth of 6 inches below the bottom of the wood. For larger constructions, use 4 gallons per 10 linear feet per foot of depth.

Posts Under Slabs

Intestations of Arthropods, such as Ants, Cockroaches and Scorpions inhabiting under slab areas may be controlled by drilling or injecting or horizontal routing and then injecting 1 gallon of 0.11% dilution (see Dilution Chart) per 10 square feet or 2 gallons of 0.11% dilution per 10 linear feet.

Pest Control in Crawlspace and Voids

Apply Transport Termiteicide Insecticide 0.11% dilution (see Dilution Chart) at all surfaces in crawlspace and/voids to control ants, fleas, roaches, scorpions, or other arthropods. Products in these delivery systems such as piping or flexible tubing mounted under/and/or around the structure as a crack and crevice or spot treatment. Treat surface to point of runoff. Keep children and pets off surface until dry.

General Household Pest Control - Indoor

Ants (including Bed imported)

Grails

Bed Bugs

Millipedes

Bees

Moths (including Cloth Moths)

Beetles (including Carpet Beetles)

Pillbugs

Boxelder Bugs

Scorpions

Centipedes

Silverfish

Cockroaches

Sowbugs

Crickets

Spiders (including Black Earwigs)

Widow and Brown Redback

Fleas

Ticks

Flies

Wasps

Where to Apply

Apply for residual pest control in residential and non-residential buildings and structures. Apply either as a crack and crevice, pinstream, spot, coarse, low-pressure spray (25 p.s.i. or less) or with a paintbrush.

Applicators

Apply to areas where pests hide, such as baseboards, corners, storage areas, closets, around water pipes, doors and windows, attics and eaves, behind and under refrigerators, dishwashers, cabinets, sinks, furnaces, stoves, the underside of shelves, drawers and similar areas and other possible pest harborage sites. Do not use as a space spray. Pay particular attention to cracks and crevices.

Application Rate

Apply 0.15% concentration of active ingredient in sufficient amount of water (see Dilution Chart) and apply adequately to cover 1,000 square feet. Do not apply more than 0.11% finished dilution per 1,000 square feet.

Mixing Directions

Fill tank 1/4 to 1/5 full with water.

Start pump to begin by-pass agitation and place end of treating tool in tank to allow circulation through hose. Add Transport Termiteicide Insecticide bag(s).

Add remaining amount of water. Let pump run and allow recirculation through the hose for 2 to 3 minutes.

Ants (including Carpenter Ants and Nuisance Ants)

Apply to areas where ants have been observed or are expected to forage. Particular attention should be given to treating entry points into the home or premises such as around doors and windows and other places where ants and ant trails may be found.

For added Carpenter Ant control, spray or foam into cracks and crevices or drill holes and spray, mist or foam into voids where Carpenter Ants and their nests are present.

When using Transport Termiteicide Insecticide in combination with baits, apply Transport Termiteicide Insecticide as instructed above, and use baits to other areas that have not been treated with Transport Termiteicide Insecticide.
**Conditions of Sale of Warranty and Liability:**

**NOTICE:** Read the entire Directions for Use and Conditions of Sale and Limitation of Warranty and Liability before buying or using this product. If the terms are not acceptable, return the product at once, unopened, and the purchase price will be refunded.

The Directions for Use of this product must be followed carefully. It is impossible to eliminate all risks inherently associated with the use of this product. Crop injury, ineffectiveness, or other unintended consequences may result because of such factors as manner of use or application, weather or crop conditions beyond the control of FMC Corporation or Seller. All such risks shall be assumed by Buyer and User, and Buyer and User agree to hold FMC Corporation and Seller harmless for any claims relating to such factors.

Seller warrants that this product conforms to the chemical description on the label and is reasonably fit for the purposes stated on the Directions for Use when used in accordance with the directions under normal conditions of use. TO THE EXTENT CONSISTENT WITH APPLICABLE LAW, FMC Corporation MAKES NO WARRANTIES OF MERCHANTABILITY OR OF FITNESS FOR A PARTICULAR PURPOSE, NOR ANY OTHER EXPRESS OR IMPLIED WARRANTIES WITH RESPECT TO THE SELECTION, PURCHASE, OR USE OF THIS PRODUCT TO THE EXTENT ALLOWED BY STATE LAW. Any warranties, express or implied, having been made are inapplicable if this product has been used contrary to label instructions, or under abnormal conditions, or under conditions not reasonably foreseeable to (or beyond the control of) seller or FMC Corporation and buyer assumes the risk of any such use.

To the extent consistent with applicable law, FMC Corporation or seller shall not be liable for any incidental, consequential or special damages resulting from the use or handling of this product. TO THE EXTENT CONSISTENT WITH APPLICABLE LAW, THE EXCLUSIVE REMEDY OF THE USER OR BUYER AND THE EXCLUSIVE LIABILITY OF FMC CORPORATION AND SELLER FOR ANY AND ALL CLAIMS, LOSSES, INJURIES OR DAMAGES (INCLUDING CLAIMS BASED ON BREACH OF WARRANTY, CONTRACT, NEGLIGENCE, TORT, STRICT LIABILITY OR OTHERWISE) RESULTING FROM THE USE OR HANDLING OF THIS PRODUCT SHALL BE THE RETURN OF THE PURCHASE PRICE OF THE PRODUCT OR, AT THE OPTION OF FMC CORPORATION OR SELLER, THE REPLACEMENT OF THE PRODUCT.

This Conditions of Sale and Limitation of Warranty and Liability may not be amended by any oral or written agreement.

---

**Bed Bugs**

Thorough application should be made to cracks and crevices where evidence of bed bugs occurs. This includes bed frames, box springs, inside empty dressers and clothes closets and carpet edges, high and low wall moldings and wallpaper edges. Do not use this product on bed linens, pillows, mattresses or clothes. Remove all clothes and other articles from dressers or clothes closets before application. Allow all treated areas to thoroughly dry before use. Not recommended for use as sole protection against bedbugs. If evidence of bedbugs is found in/on mattresses, use products approved for this use.

**Bees and Wasps**

To control Bees, Wasps, Hornets, and Yellow Jackets indoors, application should be made in the late evening when insects are at rest. Spray liberally into hiding and breeding places, especially under attic rafters, contacting as many insects as possible.

**Occasional Invaders**

To control Boxelder Bugs, Centipedes, Earwigs, Beelers, Millipedes, Pillbugs, and Sawbugs, apply around doors and windows and other places where these pests may be found or where they may enter premises. Spray baseboards, storage areas and other locations.

**Crawling and Flying Insect Pest**

To control Cockroaches, Crickets, Firebrats, Flies, Gnats, Midges, Moths, Scorpions, Silverfish, Spiders, apply as a coarse, low pressure spray to areas where these pests hide, such as baseboards, corners, storage areas, closets, around water pipes, doors and windows, attics and eaves, behind and under dishwashers, refrigerators, cabinets, sinks, furnaces, and stoves. The underside of shelves, drawers and similar areas. Pay particular attention to cracks and crevices.

**Important**

Do not use in food/treated areas of food/feed handling establishments, restaurants, or any other areas where food is commercially prepared or processed. Do not use in serving areas while food is exposed or is in operation. Serving areas are areas where prepared food is served, such as dining rooms, but excluding areas where food is prepared or held. In the home, all food processing surfaces and utensils should be covered during treatment or thoroughly washed before use. Exposed food should be covered or stored. Not for use in Federal/State inspected meat and poultry plants.

**Specific Indoor Pest Control Applications**

| Warehouses and Stores | Transport Termiticide Insecticide may be applied as a spot or crease treatment in non-food storage warehouses and stores. Apply no more than 0.001% dilution (see Diffusion Chart) of Transport Termiticide Insecticide per 1,000 square feet to provide adequate coverage. Apply to all areas that may harbor pests, including under and between pallets, bins and shelves. Do not apply direct to food grain bins (interior) or animals. |

**Restrictions**

Do not apply in a perimeter treatment to areas beyond 10 feet from the foundation of the structure. Do not use as a space spray. Do not use in and around the exterior perimeter of commercial barns, stables, paddocks. Do not use in grazing areas, feedlots or other similar areas used for housing, boarding, and/or rearing animals. Do not apply by air. Do not apply as a broadcast spray on lawns and turf. Do not apply in greenhouses or nurseries. Not for use on plants being grown for sale or other commercial use, or for commercial seed production, or for research purposes. Do not apply this product through any kind of irrigation system. Not for use on sod farm turf, golf course turf, or grass grown for seed. Do not apply to pets, crops, or sources of electricity. Do not treat electrically active underground services. Do not treat areas where food is exposed. Do not allow spray to contact food, foodstuffs, food contacting surfaces, food utensils or water supplies. Thoroughly wash dishes and food handling utensils with soap and water if they become contaminated by application of this product. Let surfaces dry before allowing people and pets to contact surfaces. Transport Termiticide Insecticide will not stain or damage any surface that water alone will not stain or damage. Application equipment that delivers low volume treatments, such as the Micro-Injector or Actisol applicators, may also be used to make crack and crevice, deep harborage, spot and general surface treatments of Transport Termiticide Insecticide. Wear protective clothing; unwanted goggles, gloves and a respirator approved by NIOSH, when applying to overhead areas or in poorly ventilated or confined areas.
