Pic-Clor 60 EC

A multi-purpose liquid fumigant to be used to drench irrigation systems only for preplant treatment of soil to control plant parasitic nematodes and to help manage certain soil-borne diseases and symbiont in cropland.

NOTE TO PHYSICIAN

Because rapid absorption may occur through lungs if product is aspirated and causes systemic effects, the decision to induce vomiting or not should be made by a physician. Probable mucosal damage and put on an air-purifying respirator (Type N, R, P, or HE, NIOSH approval number prefix TC-84A), or a mask with a canister approved for organic vapor (OV, NIOSH approval number prefix TC-23C) cartridge and a particulate pre-filter (Type N, R, P, or HE, NIOSH approval number prefix TC-84A), or a gas mask with a canister approved for organic vapor (NIOSH approval number prefix TC-140).

See Directions for Use, Air Monitoring Requirements, Respiratory Protection and Stop Work Triggers, number 1, Handlers Wearing Half-Face Air-Furifying Respirators for when an air-furifying respirator is required. (See label booklet for additional Precautionary Statements, including PPE requirements.)

USER SAFETY RECOMMENDATIONS

Users should:

- Wash hands before eating, drinking, chewing gum, using tobacco, or using the toilet.
- Remove clothing/PPE immediately if pesticide gets inside. Then wash thoroughly and put on new clothing/PPE.
- Remove PPE immediately after handling this product. Wash the outside of gloves before removing. As soon as possible, wash thoroughly and change into clean clothing.
Storage and Disposal
Do not contaminate water, food, or feed by storage or disposal.
Pesticide Storage: Store in a cool, dry, well-ventilated area under lock and key. Post as a pesticide or poison in accordance with state and local regulations.
Pesticide Disposal: Pesticide wastes are toxic. Improper disposal of excess pesticide and rinsates is a violation of Federal law. If these wastes cannot be disposed of by use according to label instructions, contact your state pesticide or environmental control agency, or the hazardous waste representative at the nearest EPA regional office for guidance. Because 1,3-dichloropropene is corrosive under certain conditions, flush all application equipment with fuel oil, kerosene or a similar type of petroleum solvent immediately after use. Fill pumps and meters with new motor oil or a 50% motor oil/fuel oil mixture before storing. Do not use water. Dispose of rinsate by applicable Federal, State and local regulations. Never introduce rinsate or unused product into surface or underground water supplies.
Container Handling: Persons moving, handling, or opening containers must wear the personal protective equipment specified in the Personal Protective Equipment (PPE) section of this label. Open container only in a well-ventilated area. Remove the valve protection bonnet and safety cap from the valve when it is about to be removed from the cylinder. The safety cap and valve protection bonnet must be replaced when the cylinder is not in use. Do not subject cylinders to rough handling, or to abnormal mechanical shock such as dropping, bumping, dragging, or sliding. Do not use ropes, slings, hooks, tongs, and similar handling devices for unloading cylinders. To transport heavier cylinders, use a hand truck, fork truck, or similar device to which cylinders can be firmly secured.
Refillable Container: Only the registrant is authorized to refill cylinders. Refill this container with pesticide only. Do not reuse this container for any other purpose. Carefully clean the container before final disposal is the responsibility of the person disposing of the container. Cleaning before refilling is the responsibility of the refilling firm.
Return of Containers: Cylinders are the property of the manufacturer or distributor and must be returned promptly by collect freight. Do not ship cylinders without safety caps or valve protection bonnets.
Container Disposal: To clean the container before final disposal, drain any remaining liquid from the container, using dry air pressure if necessary. Allow container to aerate for at least 5 days. After aeration, wash container using hot water; then offer container to qualified reconditioner or dispose of as directed by State or local regulations.

WARRANTY DISCLAIMER
Seller warrants that this product conforms to the chemical description on the label and is reasonably fit for the purposes stated on the label when used in strict accordance with the directions, subject to the inherent risks set forth below: SELLER MAKES NO OTHER EXPRESS OR IMPLIED WARRANTY OF MERCHANTABILITY OR FITNESS FOR A PARTICULAR PURPOSE OR ANY OTHER EXPRESS OR IMPLIED WARRANTY.

Inherent Risks of Use: It is impossible to eliminate all risks associated with use of this product. Inherent risks, lack of performance, or failure to perform to expectations may result because of such factors as use of the product contrary to label instructions (including conditions noted on the label, such as uncontrolled temperature or humidity, adverse weather conditions, etc.), abnormal conditions (such as excessive rainfall, drought, tornadoes, hurricanes), presence of other materials, or interactions with other factors, all of which are beyond the control of the seller. To the extent consistent with applicable laws, all such risks shall be assumed by buyer.

Limitation of Remedies: To the extent consistent with applicable law, the exclusive remedy for losses or damages resulting from this product (including claims based on contract, infringement, strict liability, or other legal theories), shall be limited to, at the company’s election, one of the following: (1) Refund of purchase price paid by buyer or user for product or (2) Replacement of product. To the extent consistent with applicable law, the company shall not be liable for losses or damages resulting from the use of this product unless the company is promptly notified of such loss or damage in writing. To the extent consistent with applicable law, the company shall not be liable for consequential or incidental damages or losses. The terms of the Warranty Disclaimer above and this Limitation of Remedies cannot be avoided by any written or verbal representation, or omission by employee or sales agent of the company or the seller is authorized to vary or exceed the terms of the Warranty Disclaimer or this Limitation of Remedies in any manner.

Pic-Clor 60 EC
A multi-purpose liquid fumigant to be used in drip irrigation systems only for preplant treatment of soil to control plant parasitic nematodes and to help manage certain soil-borne diseases and syphilis in cropland.

ACTIVE INGREDIENTS:
Chloropicrin ................................................................ 56.6% 1,3-Dichloropropene ........................................ 37.1%
OTHER INGREDIENTS: ................................................. 6.3% TOTAL: ................................................................. 100.0%

This product weighs 11.81 lbs./gal. at 68°F (20°C). Contains 4.49 pounds of 1,3-Dichloropropene and 6.73 pounds of Chloropicrin per gallon.

KEEP OUT OF REACH OF CHILDREN
DANGER PELIGRO
POISON
Si Usted no entiende la etiqueta, busque a alguien para que se la explique a Usted en detalle.

In all cases of overexposure, get medical attention immediately. Take person to a doctor or to an emergency treatment facility.

FIRST AID

IF INHALED:
• Move person to fresh air.
• If person is not breathing, call 911 or an ambulance, and then give artificial respiration, preferably by mouth-to-mouth, if possible.
• Call a poison control center or doctor for further treatment advice.

IF ON SKIN OR CLOTHING:
• Take off contaminated clothing.
• Rinse skin immediately with plenty of water for 15-20 minutes.
• Call a poison control center or doctor for treatment advice.

IF IN EYES:
• Hold eyes open and rinse slowly and gently with water for 15-20 minutes.
• Remove contact lenses, if present, after 5 minutes, and then continue rinsing eyes.
• Call a poison control center or doctor for treatment advice.

IF SWALLOWED:
• Call a poison control center or doctor immediately for treatment advice.
• Have person sip a glass of water if able to swallow.
• Do not induce vomiting unless told to do so by a poison control center or doctor.
• Do not give anything to an unconscious person.

• Have the product container or label with you when calling a poison control center or doctor, or going for treatment.
• For additional information in case of an emergency, call toll free (1-800-424-9300).

NOTE TO PHYSICIAN
Because rapid absorption may occur through lungs if product is aspirated and cause systemic effects, the decision to induce vomiting or not should be made by a physician. Probable mucosal damage may contraindicate the use of gastric lavage. If lavage is performed, endotracheal and/or esophageal control is suggested. Danger from lung aspiration must be weighed against toxicity when considering emptying the stomach. Chloropicrin is a volatile liquid that is the active ingredient in tear gas. As a gas it is a powerful lacrimalator. Early symptoms of gas exposure are lacrymation, respiratory distress and vomiting. Pulmonary edema may develop later. Treatment is symptomatic.

RESTRICTED USE PESTICIDE DUE TO ACUTE TOXICITY AND CARCINOGENICITY For retail sale to and use by certified applicators or persons under their direct supervision and only by those users covered by the certifier’s application certification.

EPA Reg. No. 8536-43-11200 (Date of Labeling: June 24, 2015)

PRECAUTORY STATEMENTS

HAZARDS TO HUMANS AND DOMESTIC ANIMALS

DANGER. Hazardous liquid and vapor. Fatal if inhaled or swallowed. Poisonous and liquid vapor. Corrosive. Liquid causes skin burns and irreversible eye damage. Do not breathe vapor or gas. Do not get in eyes, on skin or on clothing. May cause lung, liver, and kidney damage and respiratory system irritation upon prolonged contact. The use of this product, may be hazardous as you work. This product contains 1,3-dichloropropene, which has been determined to cause tumors in laboratory animals. Risks can be reduced by exactly following directions for use, by wearing PPE, by not putting on clothing or gloves that may cause irritation of eyes, nose and throat. Continued exposure after irritation occurs, or exposure to higher concentration may cause painful irritation or temporary blindness.

PERSONAL PROTECTIVE EQUIPMENT (PPE)

Some materials that are chemical-resistant to this product are listed below. PPE constructed of Saranex, neoprene or chloroprene polyethylene can provide short-term contact or splash protection against liquid in this product. Longer-term protection is provided by PPE constructed of Viton and Evon. Teflon, Tefzel and Fluon (for example, resister suits manufactured by Life-guard or silvershield gloves manufactured by North). Where chemical-resistant materials are required, leather, canvas, or cotton materials offer no protection from this product and must not be worn as the sole article of protection when contact with this product is possible. Where coveralls are required, they must be loose-fitting and constructed of woven fabrics (e.g., light knit cotton or cotton/polyester), non-woven fabrics (e.g., tyvek or sorbana), or fabrics containing microporous Teflon.

1. Handlers performing mechanical transfer of product – closed delivery systems must wear:
   - Long-sleeved shirt and long pants,
   - Chemical-resistant gloves, such as barrier laminate (EVAL) or viton,
   - Protective eyewear (DO NOT wear goggles), and
   - Chemical-resistant footwear with socks.

   Coveralls must be immediately available to the handler in case of an emergency.

   A NIOSH certified half-face air-purifying respirator equipped with an organic vapor (OV, NIOSH approval number prefix TC-23C) cartridge and a particulate pre-filter (Type N, R, P, or HE, NIOSH approval number prefix TC-84A), or
   - A gas mask with a canister approved for organic vapor (NIOSH approval number prefix TC-14G).

2. When performing tasks with potential for contact with liquid fumigant, all handlers (including applicators) must wear:
   - Long-sleeved shirt and long pants,
   - Chemical-resistant aprons, such as barrier laminate (EVAL) or viton,
   - Chemical-resistant apron,
   - Protective eyewear (DO NOT wear goggles),
   - Chemical-resistant footwear with socks,
   - Chemical-resistant headgear for overhead protection, and
   - A NIOSH certified half face air-purifying respirator equipped with an organic vapor (OV, NIOSH approval number prefix TC-23C) cartridge and a particulate pre-filter (Type N, R, P, or HE, NIOSH approval number prefix TC-84A).

3. If sensory irritation (tearing, burning of the eyes or nose) is experienced and handlers remain in the application block or buffer zone, handlers must wear at a minimum either:
   - A NIOSH certified full facepiece air-purifying respirator equipped with an organic vapor (OV, NIOSH approval number prefix TC-23C) cartridge and a particulate pre-filter (Type N, R, P, or HE, NIOSH approval number prefix TC-84A), or
   - A gas mask with a canister approved for organic vapor (NIOSH approval number prefix TC-14G).

4. See Directions for Use, Air Monitoring Requirements, Respiratory Protection and Stop Work Triggers, number 3, Handlers in the Application Block 5 Days after the Application is Complete Until the Entry Restricted Period Ends or in the Buffer Zone during the Buffer Zone Period.

5. Heat Illness Avoidance: Use measures to avoid or minimize heat illness while using this product. These measures include gradual adjustment to heat and respiratory stress, fans for cooling, cooling vests, frequent breaks, frequent intake of drinking water, and maintaining weight from day to day.

USER SAFETY RECOMMENDATIONS

Users should:
- Wash hands before eating, drinking, chewing gum, using tobacco, or using the toilet.
- Remove clothing/PPE immediately if pesticide gets inside. Then wash thoroughly on cool cycle or hand wash.
- Remove PPE immediately after handling this product. Wash the outside of gloves before removing. As soon as possible, wash thoroughly and change into clean clothing.

ENVIRONMENTAL HAZARDS

This pesticide is toxic to mammals and birds. Do not apply to or allow to contact any water, or to areas where surface water is present or to intertidal areas below the mean high water mark. Do not contaminate water when disposing of equipment washwaters or rinsates.

Chloropicrin has certain properties and characteristics in common with chemicals that have been detected in underground water supplies. Chloropicrin is highly soluble in water and has low adsorption to soil.

Groundwater Advisories: 1,3-dichloropropene is known to contaminate ground water. Do not apply on ground water recharge areas. Do not allow use or disposal of this product in an area where surface water is present or in intertidal areas below the mean high water mark. Groundwater contamination could result in groundwater contamination.

For untargeted applications of this product, leading and runoff may occur if there is heavy rainfall after soil fumigation.
PHYSICAL OR CHEMICAL HAZARDS
• Combustible. Do not use or store near heat or open flame.
• Do not mix or allow coming in contact with oxidizing agent. A chemical reaction hazard may occur.
• Handle carefully! Do not drop or let container become impacted by heavy objects. An explosion hazard may occur.

DIRECTIONS FOR USE
Restricted Use Pesticide
It is a violation of Federal law to use this product in a manner inconsistent with its labeling. Do not apply this product in a way that will contact workers or other persons, either directly or through drift. Only handlers may be in the application block from the start of the application period ends, and in the buffer zone during the buffer zone period. For any requirements specific to your State or Tribe, consult the agency responsible for pesticide regulation.

Agricultural Use Requirements
Use this product only in accordance with the directions on its label. The Worker Protection Standard, 40 CFR Part 170. This Standard contains requirements for the protection of agricultural workers on farms, forests, nurseries, and greenhouses, and handlers of agricultural pesticides. It contains requirements for training, decontamination, notification, and emergency assistance. The requirements in this box only apply to uses of this product that are covered by the Worker Protection Standard (WPS). No instructions elsewhere in this labeling relate to users from complying with the requirements of the WPS. For the entry restricted period and notification requirements, see the Entry Restricted Period and Notification section of this labeling. PPE For Entry During the Entry-Restricted Period: PPE for entry that is permitted by this labeling is listed in the Personal Protective Equipment (PPE) section of this labeling.

READ ALL DIRECTIONS FOR USE CAREFULLY BEFORE APPLYING. READ THE ENTIRE LABEL. USE ONLY ACCORDING TO LABEL DIRECTIONS. BEFORE BUYING OR USING THIS PRODUCT, READ “WARRANTY DISCLAIMER” AND “LIMITATION OF REMEDIES”.

Terms Used in This Labeling
Soil Fumigant Training Program: Certified applicator training that provides information on:
(1) how to correctly apply the fumigant, including how to comply with new label requirements;
(2) how to protect handlers and bystanders; determine buffer zone distances;
(3) how to complete an FMP and the post-application summary;
(4) how to determine when weather and other site-specific factors are not favorable for fumigant application; (6) how to comply with required GAPs and how to document compliance with GAPs in the FMP; and (7) how to develop and implement emergency response plans.
Fumigant: Substance capable of being dispersed into the soil and the soil has been sealed; drip lines have been purged (if applicable).
Entry Restricted Period: this period begins at the start of the application and expires depending on the application method and if tarps are used when the tarp is perforated and removed. Entry into the application block during this period is only allowed for appropriately PPE-equipped handlers performing handling tasks. See the Entry Restricted Period and Notification section for additional information. Buffer Zone: A border that connects the outermost edges of total area treated with the fumigant product. The perimeter of the application block is the border that connects the outermost edges of total area treated with the fumigant product. The perimeter of the application block is the border that connects the outermost edges of total area treated with the fumigant product. The diameter of fumigant mass applied compared to the soil surface area (e.g., pounds of product per acre). The application rate is expressed on this labeling in terms of either the “treated area application rate” or the “broadcast equivalent application rate.” The “treated area application rate” relates to only the rate of fumigant applied to the portion of the field that is fumigated (e.g., rate within the bed or strips). The “broadcast equivalent application rate” relates to the rate of fumigant applied within the entire perimeter of the application block. For banded and strip applications, the “broadcast equivalent application rate” must be calculated to determine the buffer zone distance required by this labeling. Buffer Zone: A zone around the border that connects the outermost edges of total area treated with the fumigant product. The side or end lines are perpendicular to the border that connects the outermost edges of total area treated with the fumigant product. The broadcast equivalent application rate “must be calculated to determine the buffer zone distance required by this labeling. Use this product only in accordance with its labeling and with the Worker Protection Standards (WPS). Use of Pesticides in Certain Florida Counties: Pic-Clor 60 EC shall not be applied to soil more frequently than once each year.

Product Information
This product is a multi-purpose liquid fumigant for preplant treatment of soil to control nematodes, symphyans, wireworms and certain soil-borne diseases in cropland. This product may be applied as a preplant soil treatment to control or to aid in reducing the damaging effects of certain soil-borne diseases [soil rot (soil pox) of sweet potatoes; Streptomyces scabies (potato scab or common scab of potato); bacterial wilt; black root rot; black shank diseases of tobacco; Verticillium wilt of mint, pink root of onions, pod rot of peanuts; plant parasitic nematodes [root-knot, root-lesion, root-knot causing citrus, cyst formers (golden, sugar beet, soybean), burrowing, lance, reniform, ring, spiral, sting, pin, stubby root, styelot, dagger and certain others]; symphyans (garden centipedes) and wireworms]. Before fumigation, soil sampling for the type and number of pests present is recommended. In fields where pre-treatment soil samples indicate the presence of high population levels of nematodes, a successful fumigation cannot be expected to eradicate entire populations. Therefore, post-treatment sampling is recommended to determine the need for future soil fumigation. In the following Florida counties: Brevard, Charlotte, Citrus, Collier, DeSoto, Glades, Hardee, Hendry, hernando, Highlands, Hillsborough, Indian River, Lake, Lee, Manatee, Martin, Monroe, Okeechobee, Orange, Osceola, Palm Beach, Pasco, Pinellas, Polk, Sarasota, Seminole, St. Lucie, Sumter, and Volusia. Use PIC-CLOR 60 EC only on soils that have a relatively shallow hard pan or soil layer restricting downward water movement (such as pedic horizon) within six feet of the ground surface and are capable of supporting seepage irrigation regardless of irrigation methods employed.

DO NOT APPLY WHERE SUBSURFACE DRIP IRRIGATION EQUIPMENT MIGHT RELEASE THE FUMIGANT DIRECTLY INTO SHALLOW SUBSURFACE IRRIGATION WATER.

Roadway: Portion of a street or highway improved, designed or ordinarily used for vehicular travel, exclusive of the sidewalk or shoulder even if such sidewalk or shoulder is used by persons riding bicycles. In the event a highway includes two or more separated roadways, the term roadway shall refer to any such roadway separately. Representative Handling Task: For air monitoring, the term “representative handling task” represents each handler or co-pilot, 4 shoveler, and 1 certified applicator supervising (2) two breathing zone samples could be collected; one sample for the tractor co-pilot and one sample for a downwind shoveler. Results of previous sampling may indicate which tasks and locations are worst case and therefore representative of all handlers.

Application Restrictions
• The use of this product is restricted to the methods described in this label.
• Do not formulate and/or tank mix this product into other end-use agricultural products.
• An application block treated with Pic-Clor 60 EC must not be within 100 feet of an occupied structure. No person shall be present at this structure at any time during the seven consecutive day period after the application is complete. EXCEPTION: This restriction does not apply to uses on soils that have not experienced a 1,3-Dichloropropene treatment in the past 2 years. This product contains 1,3-Dichloropropene and can be planted with fruit trees, nut and nursery crops, perennial vines, hops, mint or pineapple.
• Pic-Clor 60 EC shall not be applied to soil more frequently than once each year.
• Apply this product only through drip (trickle) irrigation systems. Do not apply this product through any other type of irrigation system.
• Do not connect an irrigation system used for pesticide application to a public water system unless the pesticide label-prescribed safety devices for public water systems are in place.
• Do not apply within 100 feet of any well used for water supplies for public use.
• Do not apply within 100 feet of any well used for water supplies for public use.
• Do not apply within 100 feet of any well used for potable water. Do not apply this product within 100 feet of the edge of karst topographical features. Karst topography is identified from landscape features that result from the dissolving activity of water in carbonate rock formations (limestone, dolomite and marble). Surface features that are associated with karst topography include sinkholes, caverns, springs, and sinking or disappearing streams. In North Dakota, South Dakota, Montana, Missouri, New Haven, New York, Maine, New Hampshire, Vermont, Massachusetts, Utah, and Montana: Where groundwater aquifers exist at a depth of 50 feet or less from the surface, do not apply this product where soils are Hydrologic Group A.
• This product is prohibited from sale, sale into, use, or distribution in Nassau and Suffolk Counties, New York.
• Use of Pic-Clor 60 EC is prohibited in Broward and Dade Counties, Florida.
Certified Applicator Training

Any certified applicator supervising a soil fumigant application must have successfully completed one of the soil fumigant training programs listed on the following EPA website www.epa.gov/fumiganttraining for the fumigant application being supervised. The FMP must document the date and location where the soil fumigant training program was completed.

Handlers

The following activities are prohibited from being performed by anyone other than applicators who have been appropriately trained and equipped as handlers in accordance with the requirements in WPS (40 CFR Part 170):

- Participating in the application as supervisors, loaders, drivers, tractor co-pilots, shovellers, cross ditchers, or as other direct application participants;
- Installing, repairing, operating, or removing irrigation equipment;
- Performing scouting, crop advising, or monitoring tasks;
- Installing, perforating (cutting, punching, slicing, poking), or removing tarp; and
- Repairing or monitoring tarps up to 14 days after application is complete if tarp are not perforated and removed during those 14 days.

NOTE: see Tarp Perforation and/or Removal section on this labeling for requirements about when tarps are allowed to be perforated.

Protection for Handlers

Supervision of Handlers:

- For water-run applications (e.g., drip), a certified applicator must be in the line of sight of the application at the start of the application, including set-up, calibration, and initiation of the application.
- A certified applicator may leave but must return at least every two hours to visually inspect the equipment to ensure proper functioning, and must document the time work began and when work is complete. WPS-trained handlers may perform these monitoring functions in place of a certified applicator but they must be under the supervision of a certified applicator and be able to communicate with a certified applicator at all times during monitoring activities via cell phone or other means.
- The certified applicator or WPS trained handlers under the supervision of and in communication with the certified applicator shall shut the system down if they note the necessary adjustments should the need arise.
- For handling activities that take place after the application is complete until the entry restricted period expires, the certified applicator is not required to be on-site, but must have communicated in a manner that can be understood by the site owner and handlers responsible for carrying out those activities the information necessary to comply with the label and procedures described in the FMP (e.g., emergency response plans and procedures).

Reinfestation of treated soil do not use irrigation equipment to ensure proper functioning, and must document the time work began and when work is complete. WPS-trained handlers may perform these monitoring functions in place of a certified applicator but they must be under the supervision of a certified applicator and be able to communicate with a certified applicator at all times during monitoring activities via cell phone or other means.

Protection for Handlers

Exclusion of Non Handlers from the Application Block and Buffer Zone:

The certified applicator supervising the application and the owner of the establishment where the application is taking place must make sure that all persons who are not trained and PPE-equipped and who are not performing one of the handling tasks as stated in this labeling are:

- excluded from the application block during the entry restricted period, and
- excluded from the buffer zone during the buffer zone period (see buffer zone exemption for transit on roadways in Buffer Zone Requirements section).
Air Monitoring Requirements, Respiratory Protection, and Stop Work Triggers

Air Monitoring Requirements
- When air-purifying respirators (full facepiece or gas mask) are worn, air monitoring samples for chloropicrin must be collected at least every 2 hours in the breathing zone of a handler performing a representative handling task.
- When breathing zone samples are required, they must be taken outside respiratory protection equipment and within a 10-inch radius of the handler’s nose and mouth.
- When using devices to monitor air concentration levels, a direct read detection device, such as an electronic device or a colorimetric device (e.g., Matheson-Kitagawa, Draeger, or Sensidyne) must be used. The devices must have sensitivity of at least 0.15 ppm for chloropicrin. Persons using direct read detection devices must follow the manufacturer’s directions.

Respiratory Protection and Stop Work Triggers

1. Handlers Wearing Half-Face Air-Purifying Respirators
   [Handlers are required to start work in half-face air-purifying respirators.] The Air Monitoring Requirements section above must be followed.
   - If at any time any handler experiences sensory irritation (tearing, burning of the eyes or nose) while wearing a half-face respirator then either:
     - (OPTION 1) An air-purifying respirator (full facepiece or gas mask) must be worn by all handlers who remain in the application block or surrounding buffer zone, or
     - (OPTION 2) Operations must cease and handlers not wearing air-purifying respirators (full facepiece or gas mask) must leave the application block and surrounding buffer zone.

For OPTION 1 [all handlers are wearing air-purifying respirators (full facepiece or gas mask)]:
   - Two consecutive chloropicrin breathing zone samples taken at the handling site at least 15 minutes apart must be less than 0.15 ppm, and
   - Cartridges/canisters have been changed.

For OPTION 2 (Operations ceased):
   - If at any time any handler experiences sensory irritation (tearing, burning of the eyes or nose) then either:
     - (OPTION 1) An air-purifying respirator (full facepiece or gas mask) must be worn by all handlers who remain in the application block or surrounding buffer zone, or
     - (OPTION 2) Operations must cease and handlers not wearing an air-purifying respirator (full facepiece or gas mask) must leave the application block and surrounding buffer zone.

For OPTION 1 [all handlers are wearing air-purifying respirators (full facepiece or gas mask)]:
   - Two consecutive chloropicrin breathing zone samples taken at the handling site at least 15 minutes apart must be less than 0.15 ppm, and
   - Cartridges/canisters have been changed.

2. Handlers in the Application Block within 5 Days after the Application is Complete
   [Handlers are required to start work in air-purifying respirators (full facepiece or gas mask).] The Air Monitoring Requirements section above must be followed.
   - If at any time (1) a handler experiences sensory irritation when wearing an air-purifying respirator (full facepiece or gas mask), or (2) a chloropicrin air sample is greater than or equal to 1.5 ppm, then all activities must cease and handlers must be removed from the application block and the surrounding buffer zone.
     - During the collection of air samples an air-purifying respirator (full facepiece or gas mask) must be worn by the handler taking the air samples. Samples must be taken where the sensory irritation was first experienced or where sample(s) were greater than or equal to 1.5 ppm.
     - Two consecutive chloropicrin breathing zone samples taken at the handling site at least 15 minutes apart must be less than 0.15 ppm, and
     - Cartridges/canisters have been changed.
   - During the collection of air samples an air-purifying respirator (full facepiece or gas mask) must be worn by the handler taking the air samples. Samples must be taken where the sensory irritation was first experienced.

For OPTION 2 (Operations ceased):
   - If at any time: (1) a handler experiences sensory irritation when wearing an air-purifying respirator (full facepiece or gas mask) or (2) a chloropicrin breathing zone sample is greater than or equal to 1.5 ppm, then all handler activities must cease and handlers must be removed from the application block and the surrounding buffer zone.
     - During the collection of air samples an air-purifying respirator (full facepiece or gas mask) must be worn by the handler taking the air samples. Samples must be taken where the sensory irritation was first experienced or where sample(s) were greater than or equal to 1.5 ppm.
     - Two consecutive chloropicrin breathing zone samples taken at the handling site at least 15 minutes apart must be less than 0.15 ppm, and
     - Cartridges/canisters have been changed.

3. Handlers in the Application Block 5 Days after the Application is Complete, Until the Restricted Period Ends or in the Buffer Zone During the Buffer Zone Period
   - If at any time (1) a handler experiences sensory irritation when wearing an air-purifying respirator (full facepiece or gas mask), or (2) a chloropicrin air sample is greater than or equal to 1.5 ppm, then all activities must cease and handlers must be removed from the application block and surrounding buffer zone.

 Handlers can resume operations wearing half-face air-purifying respirators if all of the following conditions exist:
   - Two consecutive chloropicrin breathing zone samples taken at the handling site at least 15 minutes apart must be less than 0.15 ppm, and
   - Cartridges/canisters have been changed.

The Air Monitoring Requirements section above must be followed.
Tarp Perforation and/or Removal

IMPORTANT: Persons perforating, repairing, removing, and/or monitoring tarps are defined, within certain time limitations, as handlers (see Handlers section), and they must be provided the PPE and other protections for handlers as required in this labeling and in the Worker Protection Standard for Agricultural Pesticides.

- Tarps must not be perforated until a minimum of 5 days (120 hours) have elapsed after the application is complete.
- If tarps are perforated within 14 days after the application is complete, tarp removal must not begin until at least 2 hours after tarp perforation is complete.
- If tarps are perforated but not removed within 14 days after the application is complete, planting or transplanting must not begin until at least 48 hours after the tarp perforation is complete.
- If tarps are not perforated or removed within 14 days after the application is complete, planting or transplanting may take place while the tarps are being perforated.
- Tarps may be perforated manually ONLY for the following situations:
  - At the beginning of each row when a coulter (or other device which performs similarly) is used on a motorized vehicle such as an ATV.
  - In fields that are 1 acre or less.
  - During flood prevention activities.
- In all other instances tarps must be perforated (cut, punched, poked, or sliced) only by mechanical methods.

Entry Restricted Period and Notification

Entry restricted period
Entry into the application block (including early entry that would otherwise be permitted under the WPS) by any person – other than a correctly trained and PPE-equipped handler who is performing a handling task listed on this labeling – is PROHIBITED - from the start of the application until:
- 5 days (120 hours) after the application is complete for unvented applications, or
- 5 days (120 hours) after the application is complete if tarps are not perforated and removed for at least 48 hours after the application is complete, or
- 48 hours after tarp perforation is complete if tarps will be perforated within 14 days after the application is complete and will not be removed for at least 14 days after the application is complete, or
- Tarp removal is completed if tarps are both perforated and removed less than 14 days after the application is complete.

NOTES:
- See Tarp Perforation and/or Removal section on this labeling for requirements about when tarps are allowed to be perforated.
- When listing application information for soil fumigant applications to comply with part 170.122 of the WPS, list the entry restricted period time frame in place of the REI.

Notification
Notify workers of the application by warning them orally and by posting Fumigant Treated Area signs. The signs must bear the skull and crossbones symbol and state:
- "DANGER/PELIGRO"
- "Area under fumigation, DO NOT ENTER / NO ENTRE"
- "1,3-dichloropropene and chloropicrin fumigants in use"
- The date and time of fumigation
- The date and time entry restricted period is over
- "PIC-CLOR 60 EC", and
- Name, address, and telephone number of the certified applicator in charge of the fumigation.

Post the Fumigant Treated Area sign instead of the WPS sign for this application, but follow all WPS requirements pertaining to location, legibility, text size, and sign size (40 CFR §170.120).

Post Fumigant Treated Area signs at all entrances to the application block no sooner than 24 hours prior to application.

Fumigant Treated Area signs must remain posted for no less than the duration of the entry restricted period.

Fumigant Treated Area signs must be removed within 3 days after the end of the entry restricted period.

Mandatory Good Agricultural Practices (GAPs)

The following GAPs must be followed during all fumigant applications.

Application Timing
Apply PIC-CLOR 60 EC at any time of the year when soil conditions permit. Conditions that allow rapid diffusion of the fumigant as a gas through the soil normally give the best results. Because PIC-CLOR 60 EC does not provide residual control of soil pests, use it as a preplant application before planting each crop.

Tarps (when tarps are used in PIC-CLOR 60 EC applications)
- Tarps must be put in place before the application starts.
- Tarp edges must be buried along the furrow and at the ends of rows.
- A written tarp plan must be developed and included in the PMP.
- Once a tarp is perforated, the application is no longer considered tarped.
- For unvented applications, the drip tape must be buried at a minimum of 6 inches.

Weather Conditions
- To determine if unfavorable weather conditions exist or are predicted (see Identifying Unfavorable Weather Conditions section) and whether an application should proceed, the National Weather Service weather forecast must be checked by the certified applicator supervising the application:
  - on a daily basis during the application if the time period from the start of the application until the application is complete is greater than 24 hours.
  - Do not apply if an air stagnation advisory issued by the National Weather Service is in effect for the area in which the application is planned, during the application, or the 48 hours after the application is complete.
  - Do not apply if light wind conditions (< 2 mph) are forecast to persist for more than 18 consecutive hours from the time the application starts until 48 hours after the application is complete.
  - Detailed National Weather Service forecasts for local weather conditions, wind speed, and air stagnation advisories may be obtained on-line at: http://www.nws.noaa.gov, on NOAA weather radio, or by contacting your local National Weather Service Forecasting Office.

Identifying Unfavorable Weather Conditions

Unfavorable weather conditions block upward movement of air, which results in trapping fumigant vapors near the ground. The resulting air mass can move off-site in unpredictable directions. These conditions typically exist within an hour prior to sunset and continue past sunrise and may persist as late as noontime. Unfavorable conditions are common on nights with limited cloud cover and light to no wind and their presence can be indicated by ground fog or smog and can also be identified by a ground source that flattens out below a ceiling layer and moves laterally in a concentrated cloud.

Soil Preparation
- Soil must be properly prepared and at the surface generally be free of large clods. The area to be fumigated must be tilled to a depth of 5 to 8 inches.
- Till fields with known plowpans because they can lead to puddling of the fumigant due to inadequate soil drainage.
- Beds should be listed, shaped and ready for planting.
- Field trash must be properly managed. Residue from a previous crop must be worked into the soil to allow for decomposition prior to the start of the application. Little or no crop residue shall be present on the soil surface. Crop residue that is present must not interfere with the soil seal. Removing the crop residue prior to the start of the application is important to limit the natural "chimneys" that occur in the soil when crop residue is present. These "chimneys" allow the soil fumigants to move through the soil quickly and escape into the atmosphere. This may create potentially harmful conditions for workers and bystanders and limit the efficacy of the fumigant. However, crop residue on the field serves to prevent soil erosion from both wind and water and is an important consideration. To accommodate erosion control, fumigant efficacy, and human health protection, clear fields of crop residue as close to the start of the application as possible to limit the length of time that the soil would be exposed to potentially erosive weather conditions.

Soil Moisture
- For all soil types, pre-application moisture should be dry enough to prevent soil saturation and bed collapse once application and flushing is complete.
- Soil moisture should when possible be at 50% of field capacity in the top 2-3’ at time of PIC-CLOR 60 EC application.
The system must contain:

- To inject fumigant, use a metering system.

System Controls and Integrity:

- The irrigation system (main lines, headers, drip tape) must be thoroughly checked for leaks before the start of application. Leak detection requires that the irrigation system be at full operating pressure. The amount of time needed at full operating pressure will vary by irrigation system design. Look for puddling along major pipes (holes in pipes or leaky joints), at the top and ends of rows (leaky connection, open drip tape), and on the bed surface (damaged drip tape, malfunctioning emitters). Any leaks discovered during the pre-application check must be repaired prior to the start of the application.

- To inject fumigant, use a metering system (such as a positive pressure system, positive displacement injection pump, diaphragm pump, or a Venturi system) effectively designed and constructed of materials that are compatible with the fumigant and capable of being fitted with system interlocking controls. Do not use containers, pumps, or other equipment made of aluminum, magnesium or their alloys, as chloropicrin and 1,3-dichloropropene can be corrosive to such metals. Do not use drip tube materials made of aluminum, magnesium, zinc, cadmium, tin, and alloys or vinyl. Use drip irrigation components made only of copper, stainless steel, steel, polypropylene, polyethylene, nylon, Teflon, rigid PVC, EPDM, and viton. Rigid PVC should not be exposed to undiluted PIC-CLOR 60 EC or more than 1,500 ppm PIC-CLOR 60 EC in the diluted form.

- The system must contain:
  - A functional check valve, a vacuum relief valve, and low-pressure drain appropriately located on the irrigation pipeline to prevent water source contamination and backflow;
  - A functional, automatic, quick-closing check valve to prevent the flow of fluids back toward the fumigant container;

The irrigation system (main lines, headers, drip tape) must be thoroughly checked for leaks before the start of application. Leak detection requires that the irrigation system be at full operating pressure. The amount of time needed at full operating pressure will vary by irrigation system design. Look for puddling along major pipes (holes in pipes or leaky joints), at the top and ends of rows (leaky connection, open drip tape), and on the bed surface (damaged drip tape, malfunctioning emitters). Any leaks discovered during the pre-application check must be repaired prior to the start of the application.

- To inject fumigant, use a metering system (such as a positive pressure system, positive displacement injection pump, diaphragm pump, or a Venturi system) effectively designed and constructed of materials that are compatible with the fumigant and capable of being fitted with system interlocking controls. Do not use containers, pumps, or other equipment made of aluminum, magnesium or their alloys, as chloropicrin and 1,3-dichloropropene can be corrosive to such metals. Do not use drip tube materials made of aluminum, magnesium, zinc, cadmium, tin, and alloys or vinyl. Use drip irrigation components made only of copper, stainless steel, steel, polypropylene, polyethylene, nylon, Teflon, rigid PVC, EPDM, and viton. Rigid PVC should not be exposed to undiluted PIC-CLOR 60 EC or more than 1,500 ppm PIC-CLOR 60 EC in the diluted form.

- The system must contain:
  - A functional check valve, a vacuum relief valve, and low-pressure drain appropriately located on the irrigation pipeline to prevent water source contamination and backflow;
  - A functional, automatic, quick-closing check valve to prevent the flow of fluids back toward the fumigant container;

A functional, normally closed solenoid-operated valve located on the intake side of the injection point and connected to the system interlock to prevent the fumigant from being withdrawn from the supply tank when the infiltration system is either automatically or manually shut down; and

- Functional interlocking controls to automatically shut off the fumigant injection when the irrigation water flow stops or decreases to the point where fumigant distribution is adversely affected

Site of Injection and Irrigation System Layout:

- Site of injection must be as close as practical to the area being treated (such as direct injection of fumigant into the header pipe/manifold or into an above-ground delivery pipe attached to the header). If the fumigant is injected into a main line, make sure the irrigation pipe is able to be cleared of all fumigant as the fumigant may pool in low sections of the pipe. Also make sure that valves on lateral lines of the main line are closed if these lateral lines lead to areas not being fumigated at the time of the application.

System Flush:

- After application of the fumigant, continue to drip-irrigate the area with water to flush the irrigation system. Do not allow the fumigant to remain in the irrigation system after the application is complete. The total volume of water, including the amount used for flushing the irrigation system, must be adequate to completely remove the fumigant from the lines, but should be less than the amount that could over-saturate the beds (bed collapse can occur from over-saturation and should not exceed 1.5 acre-inches (40,000 gallons) of water per acre. If common lines are used for both the fumigant application and water seal (if a water seal is applied) these lines must be adequately flushed before starting the water seal and/or normal irrigation practices.

Planting Interval:

- After fumigation, to prevent phytotoxicity, allow the fumigant to dissipate completely before planting the crop. Do not disturb treated soil for at least 2 weeks. Under optimum soil conditions for dissipation, 1 week for each 10 gallons/acre is recommended, with a minimum interval of 14 days following application. Wet soil retards diffusion of the fumigant thus requiring a longer aeration period. Aeration is usually complete when the odor of the fumigant is no longer evident. Seed may be used as a bioassay to determine if the product is present in the soil at concentrations sufficient to cause plant injury. Do not plant if odor of the product is present within the zone of fumigation.

Bulk and Non-Bulk Containers:

With all bulk and non-bulk containers, PIC-CLOR 60 EC must be transferred through connecting hoses, pipes, and/or couplings sufficiently tight to prevent workers or other persons from coming in contact with the liquid product.

- All hoses, piping, and tanks used in connection with this product shall be of the type appropriate for use under the pressure and vacuum conditions to be encountered.

- External sight gauges shall be equipped with valves so that lines to sight gauge can be shut off in case of breakage or leakage.

- The mechanical transfer system must be adequate to make necessary measurements of the pesticide being used.

- Shut-off devices must be installed on the exit end of all hoses and at all disconnect points to prevent leakage of this product when the transfer is stopped and hose is removed or disconnected. A dry coupler that will minimize pesticide leakage must be installed at the disconnect point.

- The pressure in hoses used to move this product beyond a pump must not exceed the manufacturer’s maximum pressure specification.

Maximum Application Rates for Pre-Plant Soil Uses:

- 503 pounds of Pic-Clor 60 EC per treated acre for drip applications

### TABLE I

<table>
<thead>
<tr>
<th>Crop</th>
<th>Soil Type</th>
<th>Maximum Application Rates (g)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Vegetable Crops, Field Crops, Fruit and Nut Crops, Nursery Crops</td>
<td>Mineral, Muck, or Peat</td>
<td>42.6</td>
</tr>
</tbody>
</table>

(a) Do not exceed specified maximum application rates in Table 1 or in the footnotes below.
(b) To control symphylans (garden centipedes) apply at 38.5 or more gallons per treated acre (454.7 lbs/treated acre) and apply during late summer or early fall when the soil is warm. To suppress wireworms, use dosages recommended for nematodes.
(c) For cyst-forming nematodes, increase dosage to 39 gallons per treated acre (460.6 lbs/treated acre).
(d) For mint, apply 42.6 gallons per treated acre (503 lbs/treated acre).

NOTE: In-tank cleaning of bulk tanks must be performed only by persons who have been specifically trained for this activity. Refer to OSHA 29 CFR Part 1910.146.

### Requirements for Pre-Plant Greenhouse Soil Fumigation:

- The maximum application block size that can be treated is 50,000 square feet.
- All applications must be tarped.
- During the application keep all doors, vents, and windows to the outside open, and keep all fans or mechanical ventilation systems running within the greenhouse.
- Leaks through which gases could enter adjacent enclosed areas must be sealed.
Calculating the Broadcast Equivalent Application Rate

To calculate the broadcast equivalent rate for bedded or strip applications the following information is needed:

- Pounds (or gallons) of product per treated acre
- Strip or bed bottom width (inches)
- Center-to-center row spacing (inches)
- Application block size (acres)

Pounds (or gallons) of product per treated acre is the ratio of total amount of product applied to the size of the total area treated (e.g., the rate of product applied in the bed). For bedded or strip applications, the total area treated is the summation of the area (i.e., length x width) of each treated bed bottom or strip that is located within the application block as shown by the black areas in Figure 1 (e.g., black areas are 0.6A or 60% of the area within the application block). The area of the space between the beds/strips is not factored in the total area treated.

The application block size is the acreage within the perimeter of the fumigated portion of a field (including furrows, irrigation ditches, roadways). The perimeter of the application block is the border that connects the outermost edges of total area treated with the fumigant product.

The “broadcast equivalent rate” must be calculated with the following formula:

\[
\text{broadcast equivalent rate} = \frac{\text{strip or bed bottom width (inches)} \times \text{pounds (or gallons) of product / treated acre applied in the strip or bed}}{\text{center-to-center row spacing (inches)}}
\]

- The bed width must be measured from the bottom of the bed.
- The center-to-center row spacing must be calculated as shown in Figure 2.
- If there are any ditches, waterways, drive rows and other areas that are not fumigated that are in the application block, multiply the above broadcast equivalent equation by (total area of strips or beds + row spacing)/(application block size). A sample calculation is provided below.
Buffer Zone Requirements
A buffer zone must be established for every fumigant application. The following describes the buffer zone requirements: An area established around the perimeter of each application block.

1. The buffer zone must extend outward from the edge of the application block perimeter equally in all directions.
2. All non-handlers, including field workers, residents, pedestrians, and other bystanders, must be excluded from the buffer zone during the buffer zone period except for transit (see Buffer Zone Exemption for Transit on Roadways).
3. Fumigant Site Monitoring

Buffer zones must not overlap multiple chloropicrin application blocks. Buffer zones from multiple fumigated fields must not overlap.

Buffer Zone Distances
Buffer zone distances must be calculated using the application rate and the size of the application block.

Buffer zone distances must be based on look-up tables in this labeling (25 feet is the minimum buffer distance regardless of site-specific application parameters).

For all other applications Tables 2 to 4 must be used to determine the minimum buffer distances as appropriate for the method of application. Round up to the nearest rate and block size, where applicable. Applications are prohibited for rates or block sizes that exceed what is presented in the buffer zone tables.

Buffer Zone Credits

The buffer zone distances for PIC-CLOR 60 EC may be reduced by the percentages listed below. Credits may be added, but credits cannot exceed 80%. Also, the minimum buffer zone distance is 25 feet, regardless of buffer zone credits available. See www.tarpcredits.epa.gov for a list of tarp materials and practices that qualify for buffer reduction credits.

- 15% reduction in buffer zone distance, IF potassium thiosulfate (KTS) is applied at a minimum rate of 0.5 pounds per acre.
- 10% reduction in buffer zone distance, IF the organic content of the soil in the application block is > 1% - 2%; a 20% reduction in buffer zone distance, IF the organic content of the soil in the application block is > 2% - 3%; and a 30% reduction in buffer zone distance, IF the organic content of the soil in the application block is > 3%.

Posting Fumigant Buffer Zones

- Posting of a buffer zone is required unless there is a physical barrier that prevents bystander access to the buffer zone.
- Buffer Zone signs must be placed along or outside the perimeter of the buffer zone, at all usual points of entry, and along likely routes of approach from areas where people not under the owner’s control may approach the buffer zone.
- Examples of likely routes of entry include, but are not limited to, roadways, sidewalks, paths, and bike trails.
- Some examples of points of entry include, but are not limited to, the area between a buffer zone and a roadway, or the area between a buffer zone and a housing development.
- When posting, the certified applicator supervising the application must ensure compliance with all local laws and regulations.
- Buffer Zone signs must meet the following criteria:
  - The printed side of the sign must face away from the application block toward areas from which people could approach.
  - Signs must remain legible during the entire posting period and must meet the general standards outlined in the WPS for sign size, text size, and legibility (see 40 CFR §170.120).
  - Signs must be posted no sooner than 24 hours prior to the start of the WPS and remain posted until the buffer zone period has expired.
  - Signs must be removed within 3 days after the end of the buffer zone period.
  - Buffer Zone signs which meet the criteria above will be provided at points of sale for applicators to use. Templates may be downloaded from http://www.epa.gov/pesticides/reregistration/soil_fumigants/index.htm
  - The Buffer Zone signs must contain the following information:
    - The ‘Do Not Walk’ symbol
    - DO NOT ENTER/NO ENTRE.
    - Chloropicrin/1,3-Dichloropropene PIC-CLOR 60 EC Fumigant BUFFER ZONE.
    - Contact information for the certified applicator in charge of the fumigation.

Exception: If multiple contiguous blocks are fumigated within a 14-day period, the entire periphery of the contiguous blocks’ buffer zones may be posted. Buffer Zone signs must be posted no sooner than 24 hours prior to the start of the first application. The signs must remain posted until the last buffer zone period expires, and the signs must be removed within 3 days after the buffer zone period for the last block has expired.

Contact information for the certified applicator in charge of the fumigation.
Restrictions for Difficult to Evacuate Sites

Difficult to evacuate sites are pre-K to grade 12 schools, state-licensed daycare centers, nursing homes, assisted living facilities, hospitals, in-patient clinics, and prisons.

- No fumigant application with a buffer zone greater than 300 feet is permitted within 1/4 mile (1,320 feet) of difficult to evacuate sites unless the site is not occupied by children from state-licensed day care centers, students (pre-K to grade 12), patients, or prisoners during the application and the 36-hour period following the end of the application.
- No fumigant application with a buffer zone of 300 feet or less is permitted within 1/8 mile (660 feet) of difficult to evacuate sites unless the site is not occupied by children from state-licensed day care centers, students (pre-K to grade 12), patients, or prisoners during the application and the 36-hour period following the end of the application.

Emergency Preparedness and Response Measures:

If the buffer zone is 25 feet, then the Emergency Preparedness and Response Measures are not applicable.

Triggers for Emergency Preparedness and Response Measures

The certified applicator must either follow the directions under the Fumigant Site Monitoring section or follow the directions under the Response Information for Neighbors section if:
- the buffer zone is greater than 25 feet but less than or equal to 100 feet, and there are residences or businesses within 50 feet from the outer edge of the buffer zone, or
- the buffer zone is greater than 100 feet but less than or equal to 200 feet, and there are residences or businesses within 100 feet from the outer edge of the buffer zone, or
- the buffer zone is greater than 200 feet but less than or equal to 300 feet, and there are residences or businesses within 200 feet from the outer edge of the buffer zone, or
- the buffer zone is greater than 300 feet or the buffer zones overlap, and there are residences or businesses within 300 feet from the outer edge of the buffer zone.

Fumigant Site Monitoring

NOTE: Fumigant Site Monitoring is ONLY required if the Emergency Preparedness and Response Measures are triggered AND directions from the Response Information for Neighbors section are not followed.

From the start of the application until the buffer zone period expires, a certified applicator or handler(s) under his/her supervision must:
- Monitor for sensory irritation in areas between the buffer zone outer perimeter and residences and businesses that trigger this requirement.
- Monitoring for sensory irritation must begin in the evening on the day of application and continue until the buffer zone period expires. Monitor a minimum of 8 times during the buffer zone period, including these periods:
  - 1 hour before sunset,
  - during the night,
  - 1 hour after sunrise, and
  - during daylight hours.

Implement the emergency response plan immediately if a handler monitoring experiences sensory irritation.

Handlers performing fumigant site monitoring outside of the buffer zone are not required to wear an air-purifying respirator.

Response Information for Neighbors

NOTE: Response Information for Neighbors is ONLY required if the Emergency Preparedness and Response Measures are triggered AND directions from the Fumigant Site Monitoring section are not followed.

The certified applicator supervising the application must ensure that residences and businesses that trigger the requirement have been provided the response information at least 1 week before the application starts. The information provided may include application dates that range for no more than 4 weeks. If the application does not occur when specified, the information must be delivered again.

Information that must be included:
- The location of the application block.
- Fumigant(s) applied including the active ingredient, name of the fumigant product(s), and the EPA Registration number.
- Contact information for the applicator and property owner.
- Time period in which the application is planned to take place (must not range more than 4 weeks).
- Early signs and symptoms of exposure to the fumigant(s) applied, what to do, and who to call if you believe you are being exposed (911 in most cases).
- How to find additional information about fumigants.

The method used to share the response information for neighbors can be accomplished through mailings, door hangers, or other methods that will effectively inform the residences and businesses within the required distance from the edge of the buffer zone.

Notice to State and Tribal Lead Agencies

If your state and/or tribal lead agency requires notice, information must be provided to the appropriate state or tribal lead agency prior to the application. Please refer to www.epa.gov/fumigantstatenotice for a list of states and tribal lead agencies that require notice and information on how to submit the information.

The information that must be provided to state and tribal lead agencies includes the following:
- Location of the application blocks,
- Fumigant(s) applied including EPA registration number,
- Applicator and property owner contact information, and
- Time period that fumigation may occur.

Emergency Response Plan

The certified applicator must include in the FMP a written emergency response plan that identifies:
- Evacuation routes,
- Locations of telephones,
- Contact information for first responders and local state/federal/tribal personnel, and
- Emergency procedures/responsibilities (e.g., adding water to the field, repairing tarps, fixing equipment, evacuating upwind) if:
  - there is an incident,
  - sensory irritation is experienced outside of the buffer zone, and/or
  - there are equipment/tarp/seat failure or complaints, or other emergencies.

Site-Specific Fumigation Management Plan (FMP)

Prior to the start of application, the certified applicator supervising the application must verify that a site-specific FMP exists for each application block. In addition, an agricultural operation fumigating multiple application blocks may format the FMP in a manner whereby all of the information that is common to all the application blocks is captured once, and any information unique to a particular application block or blocks is captured in subsequent sections. The FMP must be prepared by the certified applicator, the site owner, registrant, or other party.

The certified applicator supervising the application must verify in writing (sign and date) that the site-specific FMP(s) reflects current site conditions before the start of the application.

Each site specific FMP must contain the following elements:
- Certified Applicator Supervising the Application
  - Name,
  - Phone number,
  - Pesticide applicator license and/or certificate number,
  - Specify if commercial or private applicator,
  - Employer name,
  - Employer address, and
  - Date and location of completing EPA approved soil fumigant training program.

- General site information
  - Application block location (e.g., county, township-range-section quadrant), address, or global positioning system (GPS) coordinates
  - Verify if 1,3-dichloropropene has been used on this application block in the previous two years
  - Confirm that there will be no occupied structures within 100 feet of the application block during the 7 consecutive day period after the application is complete
  - Name, address, and phone number of applicator block owner
  - Map, aerial photo, or detailed sketch showing:
    - application block location
    - application block dimensions
    - buffer zone dimensions
    - property lines
    - roadways
    - rights-of-ways
    - sidewalks
    - permanent walking paths
    - bus stops
    - schools
    - karst topography
    - nearby application blocks
    - surrounding structures (occupied and non-occupied)
    - locations of Buffer Zone signs, and
    - locations of difficult to evacuate sites with distances from the application block labeled.

- General application information
  - Target application date/window,
  - Fumigant Product Name, and
  - EPA registration number.

- Tarp Plan (if a tarp is used)
  - Schedule for checking tarps for damage, tears, and other problems
  - Minimum size of damage that will be repaired
  - Factors used to determine when tarp repair will be conducted
  - Equipment/methods used to perforate tarps
  - Target dates for perforating tarps, and
  - Target dates for removing tarps.

- Soil conditions
  - Description of soil texture and moisture in application block, and
  - Method used to determine soil moisture

- Buffer zones
  - Application method,
  - Injection depth,
  - Application rate from lookup table on label,
  - Application block size from lookup table on label,
  - Credits applied and measurements taken (if applicable),
    - Tarp brand name, lot number, thickness, manufacturer, batch number, and part number
    - Potassium thiosulfate
    - Water seal
    - Organic matter content
    - Clay content
    - Soil temperature
For handlers designated to wear respirators (air-purifying respirator or SCBA):  
- The employer must confirm that the respirator is of medical qualification to wear a respirator.  
- The employer must confirm that the respirator is of medical qualification to wear a respirator.  
- The employer must confirm that the respirator is of medical qualification to wear a respirator.  
- The employer must confirm that the respirator is of medical qualification to wear a respirator.  
- The employer must confirm that the respirator is of medical qualification to wear a respirator.

For certified applicator(s) supervising the application: Completion date and location of the soil fumigant training program listed on the following EPA website www.epa.gov/ fumigant for the active ingredient(s) in this product.

For handlers designated to wear respirators (air-purifying respirator or SCBA):  
- The employer must confirm that the respirator is of medical qualification to wear a respirator.  
- The employer must confirm that the respirator is of medical qualification to wear a respirator.  
- The employer must confirm that the respirator is of medical qualification to wear a respirator.  
- The employer must confirm that the respirator is of medical qualification to wear a respirator.  
- The employer must confirm that the respirator is of medical qualification to wear a respirator.

Post-Application Summary

Post-Application Summary must contain the following elements:
- Actual date and time of the application
- Applicator name(s) (if applicable)
- Size of application block
- Weather Conditions
  - Summary of the National Weather Service weather forecast during the application and the 48 hours after the application is complete including:  
    - wind speed, and  
    - air stagnation advisory (if applicable).  
- Forecast must be checked on the day of, but prior to the start of the application, and on a daily basis during the application if the time period from the start of the application until the application is complete is greater than 24 hours.
- Tarp damage and repair information (if applicable):  
  - Date of tarp damage discovery,  
  - Name and location of tarp damage,  
  - Description of tarp/tarp seal/tarp equipment failure, and  
  - Date and time of tarp repair completion.
- Tarp perforation/removal details (if applicable):  
  - Date and time tarp was perforated,  
  - Date and time tarp was removed, and  
  - Record if tarp was perforated and/or removed early.  
- Record-keeping procedures (if applicable):  
  - Person filing complaint (e.g., on-site handler, person off-site),  
  - If off-site person, name, address, and phone number of person off-site,  
  - Description of control measures or emergency procedures followed after complaint.

Description of incidents, equipment failure, or other emergency and emergency procedures followed (if applicable).

Air monitoring results:  
- When sensory irritation was experienced:  
  - Date, time, location, and handler task/activity  
  - Where irritation was observed and  
  - Resulting action (e.g., implement emergency response plan, cease operations, continue operations with air-purifying respirators).
- When using a direct read detection device:  
  - Sample date(s), time(s), location(s), and concentration(s).  
  - Handler task/activity monitored (if applicable), and  
  - Resulting action (e.g., cease operations, continue operations with air-purifying respirators).

Drip application monitoring:  
- Record monitoring date(s) and time(s)  
- Name of person(s) monitoring  
- Record observations:  
  - Is the equipment functioning properly,  
  - Description of corrective action (if applicable), and  
  - Other comments.

Spill and Leak Procedures

Evacuate everyone from the immediate area of the spill or leak. For entry into affected area to correct problems, wear the personal protective equipment specified in the Personal Protective Equipment (PPE) section of this labeling. Move leaking or damaged containers outdoors or to an isolated location. Observe strict safety precautions. Work upwind, if possible. Allow spilled fumigant to evaporate or to absorb onto vermiculite, dry sand, earth, or similar absorbent material. Dispose of contaminated material on site or at an approved disposal facility. Only correctly trained and PPE-equipped handlers are permitted to perform such cleanup. Do not permit entry into the spill or leak area by any other person until the concentration of chloropicrin is measured to be less than 0.15 ppm.

Fumigant Safe Handling Information.

Record-Keeping Procedures

The owner of the application block, as well as the certified applicator supervising the application, must keep a signed copy of the Post-Application Summary for 2 years from the date of application.

State and/or tribal lead agency advance notification (if state and/or tribal lead agency requires notice, provide a list of contacts that were notified and date notified)

Plan describing how communication will take place between the certified applicator supervising the application, the owner, and other on-site handlers (e.g., tarp perforators/removers, irrigators) for complying with label requirements (e.g., buffer zone location, buffer zone start and end times, timing of tarp perforation and removal, PPE).  
- Name and phone number of persons contacted by the certified applicator, and  
- Date contacted.

Handler (including Certified Applicators) Information and PPE
- Names, addresses and phone numbers of handlers  
- Names, addresses, and phone numbers for employers of handlers  
- Tasks that each handler is authorized and trained to perform

Date of PPE training for each handler
- Applicable handler PPE including:  
  - Respirator make, model, type, style, size, and cartridge/canister type  
  - SCBAs  
  - Respirator make, model, type, style, size, and cartridge/canister type  
  - Other PPE
- For handlers: Confirmation of receipt of Fumigant Safe Handling Information.

Fumigant Safe Handling Information.

- SCBAs
- Chemical-resistant gloves
- Protective eyewear (not goggles)
- Chemical-resistant headgear
- Air-purifying respirators
- Respirator make, model, type, design, style, size, and cartridge/canister type
- Other PPE

Record Keeping Procedures

For handlers designated to wear respirators (air-purifying respirator or SCBA):  
- The employer must confirm that the respirator is of medical qualification to wear a respirator.  
- The employer must confirm that the respirator is of medical qualification to wear a respirator.  
- The employer must confirm that the respirator is of medical qualification to wear a respirator.  
- The employer must confirm that the respirator is of medical qualification to wear a respirator.  
- The employer must confirm that the respirator is of medical qualification to wear a respirator.

State and/or tribal lead agency advance notification (if state and/or tribal lead agency requires notice, provide a list of contacts that were notified and date notified)

Plan describing how communication will take place between the certified applicator supervising the application, the owner, and other on-site handlers (e.g., tarp perforators/removers, irrigators) for complying with label requirements (e.g., buffer zone location, buffer zone start and end times, timing of tarp perforation and removal, PPE).  
- Name and phone number of persons contacted by the certified applicator, and  
- Date contacted.

Handler (including Certified Applicators) Information and PPE
- Names, addresses and phone numbers of handlers  
- Names, addresses, and phone numbers for employers of handlers  
- Tasks that each handler is authorized and trained to perform

Date of PPE training for each handler
- Applicable handler PPE including:  
  - Long-sleeved shirts/long pants, shoes, socks  
  - Chemical-resistant apron  
  - Chemical-resistant footwear  
  - Protective eyewear (not goggles)  
  - Chemical-resistant gloves  
  - Chemical-resistant headgear  
  - Air-purifying respirators
- Respirator make, model, type, design, style, size, and cartridge/canister type
- SCBAs
- Respirator make, model, type, design, style, size, and cartridge/canister type
- Other PPE
- For handlers: Confirmation of receipt of Fumigant Safe Handling Information.
