| North          | 1.2                  |
| North West     | 1.1                  |
| Central        | 2.3                  |
| South West     | 1.3                  |
| Coastal South  | 1.4                  |

- Spring Applications: For optimal results, apply in the spring or fall to the area listed above. Wet conditions are ideal for the product to be effective. Application should be made following the rainfall amount and the weather conditions, and the product should be applied at the recommended use rate and uniformity. When applying, use a sure-jet, or 1/2 gallon of spray water, or the product should be maintained in the area for at least 4 weeks after its application.

- Summer Applications: For optimal results, apply in the summer to the area listed above. Wet conditions are ideal for the product to be effective. Application should be made following the rainfall amount and the weather conditions, and the product should be applied at the recommended use rate and uniformity. When applying, use a sure-jet, or 1/2 gallon of spray water, or the product should be maintained in the area for at least 4 weeks after its application.

- Fall Applications: For optimal results, apply in the fall to the area listed above. Wet conditions are ideal for the product to be effective. Application should be made following the rainfall amount and the weather conditions, and the product should be applied at the recommended use rate and uniformity. When applying, use a sure-jet, or 1/2 gallon of spray water, or the product should be maintained in the area for at least 4 weeks after its application.

- Summer Applications: For optimal results, apply in the summer to the area listed above. Wet conditions are ideal for the product to be effective. Application should be made following the rainfall amount and the weather conditions, and the product should be applied at the recommended use rate and uniformity. When applying, use a sure-jet, or 1/2 gallon of spray water, or the product should be maintained in the area for at least 4 weeks after its application.

- Fall Applications: For optimal results, apply in the fall to the area listed above. Wet conditions are ideal for the product to be effective. Application should be made following the rainfall amount and the weather conditions, and the product should be applied at the recommended use rate and uniformity. When applying, use a sure-jet, or 1/2 gallon of spray water, or the product should be maintained in the area for at least 4 weeks after its application.

- Summer Applications: For optimal results, apply in the summer to the area listed above. Wet conditions are ideal for the product to be effective. Application should be made following the rainfall amount and the weather conditions, and the product should be applied at the recommended use rate and uniformity. When applying, use a sure-jet, or 1/2 gallon of spray water, or the product should be maintained in the area for at least 4 weeks after its application.

- Fall Applications: For optimal results, apply in the fall to the area listed above. Wet conditions are ideal for the product to be effective. Application should be made following the rainfall amount and the weather conditions, and the product should be applied at the recommended use rate and uniformity. When applying, use a sure-jet, or 1/2 gallon of spray water, or the product should be maintained in the area for at least 4 weeks after its application.

- Summer Applications: For optimal results, apply in the summer to the area listed above. Wet conditions are ideal for the product to be effective. Application should be made following the rainfall amount and the weather conditions, and the product should be applied at the recommended use rate and uniformity. When applying, use a sure-jet, or 1/2 gallon of spray water, or the product should be maintained in the area for at least 4 weeks after its application.

- Fall Applications: For optimal results, apply in the fall to the area listed above. Wet conditions are ideal for the product to be effective. Application should be made following the rainfall amount and the weather conditions, and the product should be applied at the recommended use rate and uniformity. When applying, use a sure-jet, or 1/2 gallon of spray water, or the product should be maintained in the area for at least 4 weeks after its application.
