Cueva® Fungicide Concentrate
Flowable Liquid Copper Fungicide

Listed by the Organic Materials Review Institute (OMRI) for use in organic production.
Intended for Commercial Use Only
Can be used up to the day of harvest

ACTIVE INGREDIENT:
Copper Octanoate (Copper Soap) ....................................................... 10.0%
CAS Reg. No. 20543-04-8
OTHER INGREDIENTS ........................................................................... 90.0%
TOTAL .............................................................................................. 100.0%
metallic copper equivalent 1.8%
one gallon contains 0.16 lbs. metallic copper equivalent

KEEP OUT OF REACH OF CHILDREN
CAUTION

See Inside Booklet for Additional Precautionary Statements, Directions for Use, and Storage and Disposal Instructions

User Safety Recommendations
Users should:
• Wash hands before eating, drinking, chewing gum, using tobacco or using the toilet.
• Remove clothing/PPE immediately if pesticide gets inside. Then wash thoroughly and put on clean clothing.
• Remove PPE immediately after handling this product. Wash the outside of gloves before removing. As soon as possible, wash thoroughly and change into clean clothing.

Environmental Hazards
This product is toxic to fish and aquatic organisms and may contaminate water through runoff. Do not apply directly to water, or to areas where surface water is present or to intertidal areas below the mean high water mark. Do not contaminate water by disposal of equipment washwaters or rinsate. This product may contaminate water through runoff. Poorly draining soils with shallow water tables are more prone to produce runoff that contains this product. Drift and runoff may be hazardous to aquatic organisms in water adjacent to treated areas.

STORAGE AND DISPOSAL
Do not contaminate water, food or feed by storage or disposal.
Pesticide Storage: Store in a secure place, away from open fire or flame. Keep container closed and reseal after use. Product may be damaged by freezing. Do not store product below 4°C. If spilled, use absorbent material and dispose of in an approved manner.
Pesticide Disposal: Waste resulting from the use of this product may be disposed of on site or at an approved waste disposal facility.
Container Handling: Nonrefillable container. Do not reuse or refill this container.

(continued)
STORAGE AND DISPOSAL (cont.)
[For containers greater than 5 gallons] Empty the remaining contents into application equipment or the tank. Fill the container ⅔ full with water. Replace and tighten closures. Tip container on its side and roll it back and forth, ensuring at least one complete revolution, for 30 seconds. Stand the container on its end and tip it back and forth several times. Turn the container over onto its other end and tip it back and forth several times. Empty the rinsate into application equipment or the tank or store rinsate for later use or disposal. Repeat this procedure two more times. Then offer for recycling, if available, or puncture and dispose of in a sanitary landfill, or by incineration, or, if allowed by state and local authorities, by burning. If burned, stay out of smoke.

DIRECTIONS FOR USE
It is a violation of Federal Law to use this product in a manner inconsistent with its labeling.

Do not apply this product in a manner that will contact workers or other persons, either directly or through drift. Only protected workers may be in the area during application. For any requirements specific to your State or Tribe, consult the agency responsible for pesticide regulation.

Read and follow all applicable directions and precautions on this label before using.

Agricultural Use Requirements
Use this product in accordance with its labeling and with the Worker Protection Standard, 40 CFR part 170. This standard contains requirements for the protection of agricultural workers on farms, forests, nurseries, and greenhouses, and handlers of agricultural pesticides. It contains requirements for training, chemical identification, and emergency assistance. It also contains specific instructions and exceptions pertaining to the statements on this label about personal protective equipment (PPE), restricted-entry interval, and notification to workers. The requirements in this box only apply to uses of this product that are covered by the Worker Protection Standard (WPS).

Entry-Restrictions: Do not enter or allow worker entry into treated areas during the restricted-entry interval of 4 hours.

PPE required for early-entry to treated areas that is permitted under the Worker Protection Standard and that involves contact with anything that has been treated, such as plants, soil, or water: long sleeved shirt, long pants, shoes, socks and chemical-resistant gloves made of any waterproof material, such as polyvinyl chloride, nitrile rubber, or butyl rubber.

Non-Agricultural Use Requirements
The requirements in this box apply to uses of this product that are NOT within the scope of the Worker Protection Standard for agricultural pesticides (40 CFR Part 170). The WPS applies when this product is used to produce agricultural plants on farms, forests, nurseries, or greenhouses.

Do not enter or allow others to enter until sprays have dried.

GENERAL INFORMATION
- CUEVA® FUNGICIDE CONCENTRATE can be applied up to the day of harvest
- No posting or eye-wash station necessary after application
- Fixed copper is one of the oldest fungicides, used to control a wide range of fungal and bacterial plant diseases. CUEVA® FUNGICIDE CONCENTRATE is a patented, fixed copper fungicide, made by combining a soluble copper fertilizer with a fatty acid. The copper and the fatty acid combine to form a copper salt of the fatty acid, known technically as a true soap. The copper soap fungicide controls listed diseases using low concentrations of copper. The net result is an effective vegetable and fruit fungicide. CUEVA® FUNGICIDE CONCENTRATE decomposes to form soluble copper, and fatty acid, both of which can be used by microbes and plants.
- This unique fatty acid based formulation helps the copper active ingredient to penetrate fungal or bacterial cells, and also helps in spreading the product on plant surfaces. The copper deratures cell proteins and causes cell "leakage".
- CUEVA® FUNGICIDE CONCENTRATE controls listed diseases of a wide range of plants, vegetables, and fruit. As with most fungicides, CUEVA® FUNGICIDE CONCENTRATE acts to protect plants from infection. Therefore, it is important to have CUEVA® FUNGICIDE CONCENTRATE on the leaf or fruit before the pathogen is able to cause an infection.
  - Fruit trees: Controls peach leaf curl, brown rot, fireblight, scab, blossom blight, leaf and fruit spot
  - Vegetables: Controls powdery mildew, downy mildew, Botrytis, Alternaria leaf blight and Septoria leaf spot.
- Use as a dormant spray for peach leaf curl.
- A wide range of bacteria and fungicide plants, however, they generally only cause a few types of diseases. When using CUEVA® FUNGICIDE CONCENTRATE, it is important to identify the type of disease in order to use the best method of disease control.
- The active ingredient in this product is exempt from the requirement for a tolerance when used (primarily) as a fungicide to growing crops using good agricultural practices.
- Controls diseases that may go dormant and overwinter.
- For use on field crops, nuts and fruit, including citrus and berries.
- Non-public health bacteria

DIRECTIONS FOR USE
Shake well before use. Most conventional liquid pesticide spray applicators can be used to apply CUEVA® FUNGICIDE CONCENTRATE to plants. A sprayer may be used to improve the spreading of CUEVA® FUNGICIDE CONCENTRATE on hard to wet plants.

Tank Mixing CUEVA® FUNGICIDE CONCENTRATE with Other Pesticides
Read and follow all applicable directions and precautions on the label of other products, before mixing with CUEVA® FUNGICIDE CONCENTRATE.

CUEVA® FUNGICIDE CONCENTRATE can be applied up to day of harvest. When tank-mixed with products, do not apply that product closer to harvest than a minimum of one day before use on the other product's label.

Pour CUEVA® FUNGICIDE CONCENTRATE into spray tank at least half filled with water using adequate agitator. When mixed with other products proven or known to be compatible, wettable powders should be added first, followed in order by flowables (such as CUEVA® FUNGICIDE CONCENTRATE), and then emulsifiable concentrates.

CUEVA® FUNGICIDE CONCENTRATE can be mixed with Bravo® (WP; 720, 500), Capstan, Daconil® 2787, Ferbam, maneb (WP or Flowable), Dithane M-45, Manzate® 200, sulfur (wettable or flowable), organic phosphates, Thiordan®, Pentathlon® DF, Pentathlon® LF, Bacillus thuringiensis Berliner, Guthion®, Pydrin®, Diatom®, malathion for use on the crops listed on this label, in accordance with the most restrictive of label limitations and precautions. Do not exceed label dosage rates. This product cannot be mixed with any product containing a label prohibition where pesticide distribution is adversely affected. CUEVA® FUNGICIDE CONCENTRATE may be mixed with chelated or liquid fertilizers. Use caution when using other product with fungicides and insecticides. Observe all cautions and limitations on all products used in mixtures.

Chemigation
Apply this product only through sprinkler systems, including center pivot, lateral move, end low, side (wheel) roll, traveller, bug gun, solid set, or hand move. Do not apply this product through any other type of irrigation system.

Crop injury, lack of effectiveness, or illegal pesticide residues in the crop can result from non-uniform distribution of treated water.

If you have questions about calibration, you should contact State Extension Service specialists, equipment manufacturers or other experts.

Do not connect an irrigation system (including greenhouse systems) used for pesticide application to a public water system unless the pesticide label-prescribed safety devices for public water systems are in place.

A person knowledgeable of the chemigation system and responsible for its operation or under the supervision of the responsible person, shall shut the system down and make necessary adjustments should the need arise.

Public water system means a system for the provision to the public of piped water for human consumption if such system has at least 15 service connections or regulary served by an average of at least 25 individuals daily at least 60 days out of the year.

Chemigation systems connected to public water systems must contain a functional, reduced-pressure zone, back flow preventer (RPZ) or the functional equivalent in the water supply line upstream from the point of pesticide introduction. As an option to the RPZ, the water from the public water system should be discharged into a reservoir tank prior the pesticide introduction. There shall be a complete physical separation between the flow outlet end of the fill pipe and the top or overflow rim of the reservoir tank of at least twice the inside diameter of the fill pipe.

The system must contain a functional check valve, vacuum relief valve, and low pressure drain appropriately located on the irrigation pipeline to prevent water source contamination from back flow.

The pesticide injection pipeline must contain a functional, automatic, quick-closing check valve to prevent the flow of fluid back toward the injection pump. The pesticide injection pipeline must contain a functional, normally closed, scleractin-operated valve located on the intake side of the injection pump and connected to the system interlock to prevent fluid from being withdrawn from the supply tank when the irrigation system is either automatically or manually shut down.

The system must contain functional interlocking controls to automatically shut off the pesticide injection pump when the water pump motor stops, or in cases where there is no water pump, when the water pressure decreases to the point where pesticide distribution is adversely affected.

The irrigation line or water pump must include a functional pressure switch, which will stop the water pump motor when the water pressure decreases to the point where pesticide distribution is adversely affected.

Systems must use a metering pump, such as a positive displacement injection pump (e.g., diaphragm pump) effectively designed and constructed of materials that are compatible with pesticides and capable of being fitted with a system interlock.

Do not apply when wind speed favors drift beyond the area intended for treatment.

Directions for use on Vegetables, Herbs, Field Crops, Nuts, Fruits including Citrus and Berries
Mix 0.5 to 2.0 gallons of CUEVA® FUNGICIDE CONCENTRATE with 30 to 100 gallons of water and apply to one acre. For application by aircraft, apply 5-25
gallons of diluted spray to one acre. Apply at least 1 quart CUEVA® FUNGICIDE CONCENTRATE per acre. For best control, begin treatment 2 weeks before disease normally appears or when weather forecasts predict a long period of wet weather. Alternatively, begin treatment when disease first appears, and repeat at 7 to 10 day intervals for as long as needed, following crop-specific application notes. Use the 2.0 gallon rate of CUEVA® FUNGICIDE CONCENTRATE, at the minimum retreatment interval for the crop, following heavy rain or when the amount of disease is increasing rapidly. If possible, time applications so that 12 hours of dry weather follow application. Use the higher rate to control diseases that may go dormant and overwinter.

CUEVA® FUNGICIDE CONCENTRATE may cause some copper toxicity on some plant species.

### Fruit and Nut Crops

<table>
<thead>
<tr>
<th>Crop</th>
<th>Disease Controlled</th>
<th>Specific Use Instructions</th>
</tr>
</thead>
<tbody>
<tr>
<td>Almonds</td>
<td>Bacterial spot, Bacterial canker (Pseudomonas syringae), Brown rot, Blossom blight, leaf and fruit spots, Coryneum blight (shot-hole), Anthracnose</td>
<td>For bacterial canker, apply as a dormant spray as buds begin to swell, repeating at the bud burst stage, and weekly thereafter as needed, up to six sprays. In fall spray again at 10 and 80% of leaf fall. For brown rot blossom blight apply full cover spray at delayed dormant (bud swell), popcorn, full bloom and petal fall stages. During wet weather, additional bloom sprays may be necessary. Do not apply more than 112 gallons of product per acre per year. Do not reapply within 5 days during the growing season or within 7 days during the dormant season.</td>
</tr>
<tr>
<td>Blueberries</td>
<td>Gray mold, mucor fruit rot, Rhizopus fruit rot</td>
<td>Apply at the start of flowering and continue every 7 to 10 days until harvest. Do not apply more than 53 gallons of product per acre per year. Do not reapply within 7 days.</td>
</tr>
<tr>
<td>Caneberry (Blackberries, Raspberries)</td>
<td>Gray mold, mucor fruit rot, Rhizopus fruit rot</td>
<td>Apply at the start of flowering and continue every 7 to 10 days until harvest. Do not apply more than 63.5 gallons of product per acre per year. Do not reapply within 7 days.</td>
</tr>
<tr>
<td>Citrus (Grapefruit, Lemon, Lime, Orange, Pummelo, Tangerine)</td>
<td>Melanose spot, greasy spot, citrus scab, Alternaria brown spot, citrus canker, Phytophthora brown rot, and Septoria.</td>
<td>Repeat every 2 weeks if necessary. May cause phytotoxicity if conditions are conducive, when mixed with other products. Do not apply more than 80 gallons of product per acre per year. Do not reapply within 7 days.</td>
</tr>
<tr>
<td>Currants, Gooseberries</td>
<td>Powdery mildew</td>
<td>Do not apply more than 102 gallons of product per acre per year. Do not reapply within 10 days.</td>
</tr>
<tr>
<td>Grapes</td>
<td>Downy mildew, black rot, phomopsis cane, leaf spot, powdery mildew, gray mold</td>
<td>Begin treatment when new growth reaches 1/2 inch and repeat at 7 to 14 day intervals throughout the growing season. Use Precaution: Do not mix CUEVA® FUNGICIDE CONCENTRATE with lime. Certain Vinifera and French Hybrid varieties may be sensitive to copper sprays resulting in marginal leaf burn. Before spraying these varieties, consult your State Experiment Station or make test sprays. Do not apply more than 127 gallons of product per acre per year. Do not reapply within 3 days.</td>
</tr>
<tr>
<td>Pome Fruits (Apples, Pears, Quince)</td>
<td>Anthracnose, Cedar Apple Rust, Fireblight, Scab, Sooty Blotch, Flyspeck, Quince Rust</td>
<td>For fireblight control, apply CUEVA® in the dormant period, during bloom, or in-season cover spray applications. May cause russetting of susceptible apple varieties. Do not exceed the 1.0 gallon of product/ 100 gallons water use rate. Do not exceed one application during the fall, late dormant period. Do not exceed one application between silver tip and green tip growth stages. Do not apply more than 102 gallons of product per acre per year. Do not reapply within 5 days.</td>
</tr>

</table>

* Not registered for use in California

- Powdery mildew: tend to occur on the upper leaf surfaces, as though a white powder was sprinkled onto the plant. Powdery mildews can form a dense, white, cottony mass, making the whole leaf appear white. They are also commonly found on stems. Powdery mildews rarely kill plants. Most fungal diseases require water to infect plants. Powdery mildews are unique in that they do not require water for infection. Shade and dense plantings also promote powdery mildew. Powdery mildews commonly occur on the following plants: bean, beet, broccoli, Brussels sprouts, cauliflower, cabbage, cantaloupe, chard, chicory, cucumber, endive, garlic, grape, hop, kale, kohlrabi, lettuce, peas, pumpkin, rutabaga, squash, strawberry, turnip, zucchini.

- Downy mildews: tend to occur on the lower leaf surfaces. Downy mildews are much thinner than powdery mildews, and appear as a fine white cotton, similar to downy mildew. Downy mildews can rapidly kill plant leaves during wet, cool weather, but are inhibited by hot dry weather. Downy mildews commonly occur on the following plants: bean, beet, broccoli, Brussels sprouts, cauliflower, cabbage, cantaloupe, chard, chicory, cucumber, endive, garlic, grape, hop, kale, kohlrabi, lettuce, onion, pea, pumpkin, rutabaga, squash, strawberry, squash, tomato, turnip, zucchini.

- Leaf and fruit spots: are small brown or black spots on the leaf or fruit. They commonly occur on apple and pear (scab). These spots can be caused by a range of fungal and bacterial plant diseases. Leaf and fruit spots are commonly caused by fungi belonging to the following genera: Alternaria, Cercospora, Colletotrichum, Cylindrosporium, Gloeosporium, Glomerella, Gnomonia, Marssonia, Mycocharalela (Didymella), Phomopsis, Phylosticta, Septoria, and Sphaeceloma. Spots on leaves and fruit can expand and grow together. Leaf spot pathogens require water to infect plants. During wet weather, spots can develop into a blight, very rapidly, killing leaves, flowers and stems.

- Rusts: are small orange blisters that appear on plant leaves, and that are full of orange powder. The orange powder is rust spores. Towards the end of the season, black spores are often produced. Rust is commonly found on grasses.

- Fruit rots: commonly occur on strawberries, raspberries, and other fruit. They appear as soft, rotten areas on the fruit. Often the causal fungus can be found growing and producing spores on the surface of the rotting area. Rots are often caused by fungi belonging to the following genera: Aspergillus, Botrytis, Monilinia, Mucor, Penicillium, Rhizopus and Sclerotinia.

* Non-public health bacteria

**NOTICE TO BUYER**

Certs USA, L.L.C. warrants that this product conforms to the chemical description on this label and is reasonably fit for the purposes stated on this label only when used in accordance with directions under normal use conditions. This warranty does not extend to use of this product contrary to label directions, or under abnormally use conditions, or under conditions not reasonably foreseeable to sell. To the extent consistent with applicable law, buyer assumes all risk of any such use. Certs USA, L.L.C. makes no other warranties, either expressed or implied.
