**GENERAL INFORMATION (WHY SLUG AND SNAIL BAIT IS EFFECTIVE)**

This product has a unique mode of action and can be used in areas where both plant and wildlife protection is necessary. When slug and snail eat the bait, they stop feeding and crawl back to their hiding places where they eventually die. It remains effective under varying weather and environmental conditions.

**WHERE TO APPLY:**

- Treat all likely areas of infestation, especially around or near the base of plants, between rows and around the perimeter of garden plots where pests travel into plant areas from daytime refuges. Slugs/snails favor damp areas around vegetable plants such as beans, tomatoes, lettuce, cabbage, celery and squash. Other favorite areas are flower gardens, includes hedges, dichondra lawns, citrus groves, ivy patches, and other ground cover where they obtain shelter to die.

**HOW TO APPLY:**

- Scatter the slug and snail bait granules on the soil around or near the plants to be protected. Use about 0.5 teaspoons per sq. yd. Place the bait on the soil surface and mix lightly into the top 1 inch of soil. Do not place in piles. The bait is consumed within 24 hours. After eating the bait, the slugs and snails cease feeding, become less mobile and begin to die within three to six days. Dead slugs and snails may not be visible as they often crawl under soil and plants to die. Final eradication will be observed in the decrease in plant damage.

**AMOUNT TO APPLY:**

- For early summer or heavy rain, use 0.5 teaspoons per sq. yd. Place the bait on the soil surface and mix lightly into the top 1 inch of soil. Do not place in piles.

**PESTICIDE DISPOSAL AND CONTAINER HANDLING:**

- Do not contaminate water, food or feed by aerially applying the product over water bodies or drainage systems. Prevent run off to water bodies or drainage systems. Applying this product near surface water will cause them to cease feeding. This physiological effect of the bait gives immediate protection to the plants even though the slugs and snails may remain in the area. After eating the bait, the slugs and snails will die, become less mobile and begin to die within three to six days. Dead slugs and snails may not be visible as they often crawl under soil and plants to die. Final eradication will be observed in the decrease in plant damage.
