The temperature at which termite activity is substantially curtailed may vary significantly between different geographic areas and with different species of termites. However, generally speaking, termite activity will be reduced in the stations during those times of the year during which the average daily mean exterior air temperature is below 50°F. The operator should always make allowances for local circumstances when considering increasing elapsed time between inspections. Under no circumstances should more than 6 mo elapse between inspections of stations. If inspection interval is on 6 mo cycle, under no circumstances should more than 8 mo elapse between inspections.

DO NOT allow extra time between inspections if stations are located in an area in or under a structure in which the average daily mean air temperature is expected to remain above 50°F and termites are actively consuming bait in the stations. Inspection intervals must comply with state regulations, where applicable.

SUPPLEMENTAL TREATMENT

This product can be applied or used as a supplemental treatment in, underneath, and/or around structures or buildings to kill termites in support of, or as a supplement to, a termiticide product labeled for and applied as a stand-alone termite treatment. This includes pre- and post-construction soil termiticide treatments labeled for providing structural protection. This product may also be used in combination with an additional termite treatment, as a supplemental treatment in areas not associated with structures or buildings, such as around trees, wood piles, landscaping elements, railroad track beds, and other areas where termite activity is known or suspected.

To provide a supplemental bait treatment, install one or more bait station(s), in the soil at or near points of known or suspected termite activity. Insert bait into the station(s) at the time of installation (DIRECT BAITING) or when termites are detected in or near a station. Baiting may be discontinued at any time at the discretion of the applicator. If continued effectiveness of the supplemental treatment is desired, stations should be inspected every 120 days.

NON-STRUCTURE SPOT TREATMENT

This product can also be applied or used as a spot treatment in areas not associated with structures or buildings, such as around trees, wood piles, landscaping elements, railroad track beds and other areas where termite activity is known or suspected. Such treatments may be made alone or in combination with an additional termite treatment. Spot treatments made with this product are not intended to, and should not be used, as a sole means for providing non-structural protection.

Installation, baiting and monitoring of spot bait treatments made with this product should follow directions provided in the “SUPPLEMENTAL TREATMENT” section above.

STORAGE AND DISPOSAL

DO NOT contaminate water, food or feed by storage or disposal.

PESTICIDE STORAGE: Store in original container in a dry storage area out of reach of children and animals.

PESTICIDE DISPOSAL: Product not disposed of by use according to label directions should be wrapped in paper and placed in a trash can.

CONTAINER HANDLING: Nonrefillable container. DO NOT reuse or refill this container. Offer for recycling if available. If recycling is not available, place container in trash.

CONDITIONS OF SALE AND WARRANTY

Follow the Directions for Use. It is impossible to eliminate all risks inherently associated with use of this product, and therefore all such risk shall be assumed by the Buyer.

BASF warrants that this product conforms to the chemical description on the label and is reasonably fit for the purposes referred to in the Directions for Use, subject to the inherent risks, referred to above.

TO THE EXTENT CONSISTENT WITH APPLICABLE LAW: (A) BASF MAKES NO OTHER WARRANTIES EXPRESS OR IMPLIED, INCLUDING WARRANTIES OF FITNESS FOR PARTICULAR PURPOSE OR MERCHANTABILITY, (B) BUYER’S EXCLUSIVE REMEDY AND BASF’S AND SELLER’S EXCLUSIVE LIABILITY, WHETHER IN CONTRACT, TORT, NEGLIGENCE, STRICT LIABILITY, OR OTHERWISE, SHALL BE LIMITED TO REPAYMENT OF THE PURCHASE PRICE OF THE PRODUCT, AND (C) BASF AND THE SELLER DISCLAIM ANY LIABILITY FOR CONSEQUENTIAL, INCIDENTAL, SPECIAL OR INDIRECT DAMAGES RESULTING FROM THE USE OR HANDLING OF THIS PRODUCT. BASF and the Seller offer this product, and the Buyer accepts it, subject to these Conditions of Sale and Warranty which may be varied only by agreement in writing signed by a duly authorized representative of BASF.

TRELONA™
Compressed Termite Bait

• For use by individuals/firms licensed or registered by the state to apply termiticide products. States may have more restrictive requirements regarding qualifications of persons using this product. Consult the structural pest control regulatory agency of your state prior to use of this product.

• A termite bait that may be used in an integrated management program for the protection of structures against subterranean termites.

ACTIVE INGREDIENT:

Novaluron: 1-[[3-chloro-4-{1,1,2-trifluoro-2-(trifluoromethyl)phenyl]3-(2,6-difluorobenzoyl)urea* . . . . . . 0.50%

OTHER INGREDIENTS: .................................................. 99.50%

TOTAL: ........................................................................ 100.00%

* Contains 0.5g of novaluron per 100g of formulation

U.S. Patent Pending

EPA Reg. No. 499-557

KEEP OUT OF REACH OF CHILDREN

CAUTION

FIRST AID

If in eyes

• Hold eyes open and rinse slowly and gently with water for 15 to 20 min.
• Remove contact lenses, if present, after the first 5 min, then continue rinsing.
• Call a poison control center or doctor for treatment advice.

HOtLINE NUMBER

Have the product container or label with you when calling a poison control center or doctor or going for treatment. You may also call 1-800-832-HELP (4357) for emergency medical treatment information.

Important: Before buying or using this product, read the entire label including the “Warranty” section of this label. If terms are not acceptable, return the unopened product container at once. Use this product only according to label directions.

BASF Corporation

Research Triangle Park, NC 27709
HAZARDS TO HUMANS AND DOMESTIC ANIMALS
Causes moderate eye irritation. Avoid contact with eyes or clothing. Wash thoroughly with soap and water after handling or before eating, drinking, chewing gum, using tobacco or using the toilet.

ENVIRONMENTAL HAZARDS
The active ingredient in this product is extremely toxic to aquatic invertebrates. DO NOT place in any area where, because of the movement of water, it could be washed into a body of water containing aquatic life, such as ponds or streams.

DIRECTIONS FOR USE
IT IS A VIOLATION OF FEDERAL LAW TO USE THIS PRODUCT IN A MANNER INCONSISTENT WITH ITS LABELING.

Read the PRODUCT INFORMATION and DIRECTIONS FOR USE carefully before using. This product is part of a termite baiting system and is intended for use in ADVANCE® Termite Bait System bait stations which may be purchased from most professional pest control product distributors. Use of this product involves the installation of bait stations and the subsequent monitoring and replenishment of pre-bait monitors and bait. When the system is inspected and replenished per label instructions, it provides on-going prevention and elimination of termite colonies. Use of this bait in any other type of station or system not approved by BASF is prohibited. Call 1-800-777-8570 for assistance in using this product or any other components of the termite baiting system.

PRODUCT INFORMATION
The active ingredient, novaluron, is an insect developmental inhibitor. This activity is consumed by a termite when it molts. Molted termites are not able to move the new exoskeleton back into its replacement exoskeleton. Termites that attempt to molt after ingesting an amount of bait sufficient to impair their molting process either die or are incapacitated by their inability to complete the molting process. Insect development inhibitors such as novaluron are characterized as slow-acting toxicants; however, their action is slow, allowing them to affect a termite at the point in its life cycle when it molts. Because all the termites in a colony DO NOT molt at the same time, the effect of novaluron on the colony as a whole is progressive. This progressive effect is one of the key attributes of novaluron as a termite colony activity.

Sufficient consumption of bait by a termite colony can cause a decline in the number of colony members. Such a decline, when sustained by continued consumption of bait by the colony, can signal a need to repair the colony viability. Further, continued consumption of bait by remaining colony members may ultimately result in the total elimination of the colony. The extent of the decline of the colony, the speed of its decline and the possibility of its elimination depends upon the extent to which bait is made continuously available to a colony for consumption and the extent to which members of the colony consume it.

ADJUSTMENTS TO INSPECTION SCHEDULING
Decreases in expected time between inspections of a baited station may be warranted if consumption of all of the bait in the station occurs during the interval between any two inspections. Because subterranean termites are cold-blooded (poikilothemic) animals, low temperatures can substantially reduce or stop their activity during the cold period of the year. This can reduce the probability of activity below a certain level for a long enough period of time. Reductions in termite activity that are the result of low temperatures may make inspections of stations unnecessary for as long as low temperatures prevail in the area.

Inspecting a Station and Placing Bait
To inspect a station, remove the cover and visually examine the interior for signs of infestation of existing structures or for preventive treatment (before signs of infestation) of existing structures.

STATION LOCATION SELECTION
To reduce the potential for tampering with and disturbance of stations, choose points of station installation that minimize installed station space product in areas where barrier type termite colonies are known to have been previously applied, such as within 2 ft of the foundation wall.

Choose areas for station installation located at or near points of known or suspected termite activity. If a point of accessible ground is not located within 10 ft of a point of known termite entry due to an intervening hardened construction surface such as a concrete slab, it may be advisable to create an access to the ground through that surface close to the point of known entry and install a station at that access.

Once termite activity has occurred at a station and bait consumption has begun, it may be advisable, depending on the rate of bait consumption in that station and nearby stations, to locate 1 or more supplemental stations in the immediate vicinity (up to 5 ft) of the infested station(s) in order that bait consumption by the colony be maximized.

STATION INSTALLATION
To install a station, excavate or form a hole in the ground approximately the same size and dimensions as those of the station. Insert the station into the hole. Maximizing contact between the exterior of the station and the earth during installation will minimize the probability of termite entrance into the station. If the station is inserted into an opening created through a hardened construction surface such as a concrete slab, asphalt, etc., insert station below the surface (in contact with the ground) and seal secure.

Install stations at, or preferably within approximately 5 ft of points of known, probable or suspected termite foraging, and at other critical areas. Such areas may include areas with concentrations of cellulose-containing debris, such as mulch or wood scraps, in contact with the ground, areas of moderate soil moisture, shaded areas, areas containing plant root systems, bat traps, visible termite foraging tubes, etc.

Install stations around a structure such that, except where sufficient access to the ground is not available, the maximum interval between any 2 stations does not exceed 20 ft. If the distance between 2 points of accessible ground around the structure exceeds 30 ft, it may be advisable to form 1 or more openings in the surface creating the inaccessibility to facilitate baiting between those points.

If the structure has an accessible crawl space, stations can be installed in the crawl space in lieu of or in addition to installing stations around the structure. Stations can be installed within a slab structure at existing or created openings in the slab surface. Stations can be installed within a slab structure at existing or created openings in the slab surface. Stations can be installed within a slab structure at existing or created openings in the slab surface. The station can be installed in a secure manner.

PRE-BAIT MONITORING SERVICE ROUTINE
The pre-bait monitoring service routine is to be followed if an operator is using pre-bait monitors followed by bait placement as needed, or direct baiting only select stations around a structure.

PRECAUTIONARY STATEMENTS
This product is intended for use in an ongoing program of management and control of subterranean termite colonies in the ground around and under any type of building or other object (structure). It does not exclude termites from a structure.

To prevent water from collecting in the station by, for example, creating a sump area under the installed station or at the bottom of the station.
